## Appendices

<b>Appendix A:</b> PTV Model Update & Calibration Documentation.....	A-1
<b>Appendix B:</b> Screenline Traffic Count Data .....	A-11
<b>Appendix C:</b> KMPO Model Land Use.....	A-21

## 1.0 Introduction

This report was developed to document the inputs, calibration and validation of the Kootenai Metropolitan Planning Organization (KMPO) travel demand model (TDM). This report is focused on the 2020 update to the KMPO travel demand model, including methodology and enhancements; the 2020 model is an update to KMPO's 2018 model. The model was developed in PTV's VISUM software.

Travel demand forecasting models update the existing base year model every year or every other year or every five years depending on the land use growth and transportation improvements in the modeling area. This is because the traffic volumes on streets and roadways change, due to the changes in the land use and the transportation system. The 2020 KMPO model update is expected to revalidate the 2018 base year model to reflect the conditions of the 2020 transportation network and land use. Many modeling components were left as they were in the 2016 model; however, this documentation outlines the changes that have been made. KMPO staff performed the 2020 model update calibration/validation with and assistance from PTV Group. Documentation of updates performed by PTV is included in Appendix A.

In this KMPO 2020 model update, KMPO staff and PTV made the following changes, which are addressed in the following sections of this report:

- Land use update
- Network updates/revisions
- ODME removed
- X-X and X-I updates
- Trip generation rate update
- Trip distribution parameter revisions
- Trip Assignment method update

Detailed technical specifications and model update descriptions are provided to assist the KMPO model users in their understanding of the model applications, data inputs and outputs, and validation results.

### 1.1 Background

KMPO was formed in 2003. The first KMPO four-step travel demand model for the AM and PM Peak Hours was developed by KMPO staff and PTV Group in 2003.

The KMPO model is based on a typical four-step gravity demand model which includes: Trip Generation, Trip Distribution, Mode Choice and Route Assignment. Mode choice is made up of private cars, public transit, and/or non-motorized travel. Currently, the KMPO model remains a three-step model, as private vehicles are the only mode included at this time. Mode choice is planned to be expanded upon in the future as the mode-splits diversify and more data is available.

The 2003 model was first updated in 2005 by PTV Group, upon the completion of KMPO's 2005 Household travel survey, in order to incorporate statistically valid data for Kootenai County travel behavior. Subsequent updates have been made to the model in 2007, 2012, 2016 and 2018. The 2020 model was completed in-house with calibration assistance from PTV Group.

The 2020 KMPO Model is a Peak Hour model and provides the existing 2020 AM and PM peak hour traffic volumes. It is used as a base model to project future traffic forecasts for the AM and PM peak hour traffic in Kootenai County.

## 1.2 Model Geography

- Kootenai County, Idaho
- 2020 County Population estimate: 171,362 (2020 Decennial Census)
- Model Vehicle Miles Traveled (VMT) estimate: 354,930 miles in the PM peak hour
- Model Vehicle Hours of Travel (VHT) estimate: 10,158 hours in the PM peak hour
- Total 2020 Occupied Dwelling Units Estimate: 67,278

## 1.3 Data Sources

Data from many agencies are compiled and analyzed for input into the travel demand model. The model is used for transportation travel demand forecasting. Ensuring that the most accurate, reliable and available data is used, as well as having a well-calibrated and validated model, is vitally important for accurate travel demand forecasting. KMPO uses the following data sources for input into the model:

- *2005 Household Travel Survey*: A regional household survey is used to estimate current travel behavior. KMPO's most recent survey was performed in 2005 and can be found on our website ([www.kmpo.net](http://www.kmpo.net)).
- *US Census Bureau Decennial Census*: (every 10 years) Transportation Analysis Zones (TAZs) are based on Census blocks. Source of 2020 dwelling unit data.
- *Idaho Department of Labor*: Source of 2019 - Quarter 3 employment data for TAZ land uses.
- *Kootenai County*: Source of 2020 structure data, additional Geographical Information Systems (GIS) data, and planning documents.
- *Local Cities/Highway Districts*: Traffic count data is obtained from each of the local agencies. Building permit data and comprehensive planning documents are also obtained from local jurisdictions.
- *Idaho Transportation Department*: Source of traffic count data on state and local roadways.
- *Local Sources*: Land use information that is not readily available is obtained through additional local sources, such as: elementary, secondary, and college enrollment; number of rooms in hotels/motels; casino parking spaces, acreage of recreation areas, etc.
- *Professional Reports*: Real Estate Reports and other verified published professional reports for reasonableness checks.
- *INRIX Origin-Destination Dataset*: Connected vehicle data, via INRIX, was used to determine the trip origins and destinations in Kootenai County for the week of April 11-15, 2022. This data was used to update the internal and external OD matrices.

## 1.4 Model Limitations and Improvements

As with previous KMPO models, the 2020 KMPO model has some limitations that lead to potential improvements in the future.

- The KMPO model is a vehicle-based travel demand forecasting model and does not have multimodal forecasting capability, as the model only follows the three steps of the traditional four-step modeling procedures: trip generation, trip distribution, and trip assignment without the mode choice modeling step.

- The model trip generation rates are simply based on the ITE Trip Generation Manual but not based on the regional travel survey data, although the total trips generated by purpose are calibrated against the 2005 Kootenai/Spokane expanded travel survey results.
- The model produces better traffic forecasts in the urbanized area with higher traffic volume than in the rural area with lower traffic volumes possibly because of the larger zones and less street network in rural areas, or because the rural areas have lower trip generation rates than the ITE urban and suburban trip generation rates used in the KMPO model. Further statistical analysis of the rural and urban area travel behaviors will help evaluate this hypothesis.
- The trip distribution patterns roughly match with the 2005 regional travel survey; the statistical results were extracted from the travel survey for the AM and PM conditions, by NuStats as requested by KMPO staff during this 2010 model update; therefore, the statistical analysis results are based on the “2005 Spokane and Kootenai County Regional Travel Survey”.
- Intersection level of service calculation can be implemented by using PTV’s VISTRO software, based on the Highway Capacity Manual, but was not done at this update and should be implemented for operational analysis in the future.
- Some local zonal details or network details may not be sufficient to reflect the traffic forecast conditions in the local sub-area transportation study and planning, or project specific sites and should be enhanced further to meet the local travel demand modeling needs in the future.

## 2.0 Model Network

In 2020, several roadway improvement projects were underway in the KMPO area. The 2020 Base model incorporates these improvements to reflect significant changes in route patterns that have occurred with project implementation.

### 2.1 Roadway Links

Roadways are represented in the model as links. Links are defined in the network by the following attributes:

- Link Type
- Capacity
- Design Speed
- One- or Two-way Direction
- Number of Lanes
- Length

These attributes are used in the model to distribute and assign trips throughout the network. Figure 1 shows how attributes are defined for a link in VISUM.

The model utilizes multiple link types for urban and rural roadways to allow for a number of analyses. The KMPO model network is primarily made up of functionally classified roadways. Some local roads have been added to

**Figure 1: Link Attributes**

The screenshot shows the 'Edit link' dialog box with the following fields and values:

- Number: 8873
- From node: 9043
- To node: 685
- Type: 24 Urban Collector Arterials I
- Transport systems: C Car
- Basics tab selected, showing:
  - Direct distance: 1.122mi
  - Length: 1.122mi
  - AddVal 1: 0
  - AddVal 2: 0
  - AddVal 3: 0
  - Plan no.: 0
  - v0 PrT: 35mph
  - Lanes: 1
  - Capacity PrT: 1000
  - HGV share (%): 0
  - VolCapRatio PrT: 8 %
  - Volume PrT [Veh]: 76
- Bar labels:
- Name: (empty field)
- Message: The link is closed for all public transport systems.

properly load traffic into the network or better define intersection operation. Each link type is defined by capacity (vehicles per hour per lane (vphpl)) and free-flow speed. These attributes differ by functional classification. Table 1 lists the link types available for the KMPO model’s roadway network. At this time, some link types are not used in the current model analysis but are retained for future model needs.

Table 1: Link Types

No.	Description	Capacity	Speed
<b>URBAN</b>			
11	Urban Interstate	1900	60
31	Proposed Urban Interstate	2000	60
16	Urban Principal Arterial III	1000	30
25	Urban Principal Arterial	1600	45
34	Proposed Urban Principal Arterial	1400	45
70	Urban Principal Arterial II	1500	35
14	Urban Minor Arterial III	900	30
23	Urban Minor Arterial	1200	30
36	Proposed Urban Minor Arterial	1200	40
45	Urban Minor Arterial II	700	25
24	Urban Collector Arterial I	1000	30
37	Proposed Urban Collector	600	35
49	Urban Collector Arterial II	600	30
19	Local Street	500	25
50	Ramps	1500	45
57	Urban Arterial Ramp	1600	45
<b>RURAL</b>			
1	Rural Freeway	1800	70
3	Rural Principal Arterial Type II	1400	50
4	Rural Principal Arterial	1200	50
22	Proposed Rural Principal Arterial	1300	60
47	Rural Minor Arterial I	1000	35
69	Rural Minor Arterial II	750	35
10	Rural Major Collector	800	45
27	Proposed Rural Major Collector	1200	45
28	Proposed Rural Minor Collector	600	35
43	Rural Minor Collector	600	40
9	Rural Local Street	500	25
51	Rural Ramps	1000	45

Links are able to be coded as both one or two-way entry. A link can be coded as one-way by only permitting the ‘Car’ transport system (TSys-Car) for the desired direction. Some arterials, such as the freeway and its ramps, are modeled as a pair of one-way links rather than one two-way link so that capacity and directional splits are modeled appropriately.

‘Number of Lanes’ is used in computing the capacity of links, as well as for intersection geometry and model analysis. Typically, only through lanes are used for this attribute. However, KMPO has added the user-defined

attribute in Visum “TWLTL” (Two-Way Left Turn Lane), which adds additional capacity to links that have center lanes for left turns. This attribute adds an additional capacity of 300 vphpl for three-lane links and 150 vphpl for five-lane links. These are added during Steps 6 and 8 of the model’s procedure sequence.

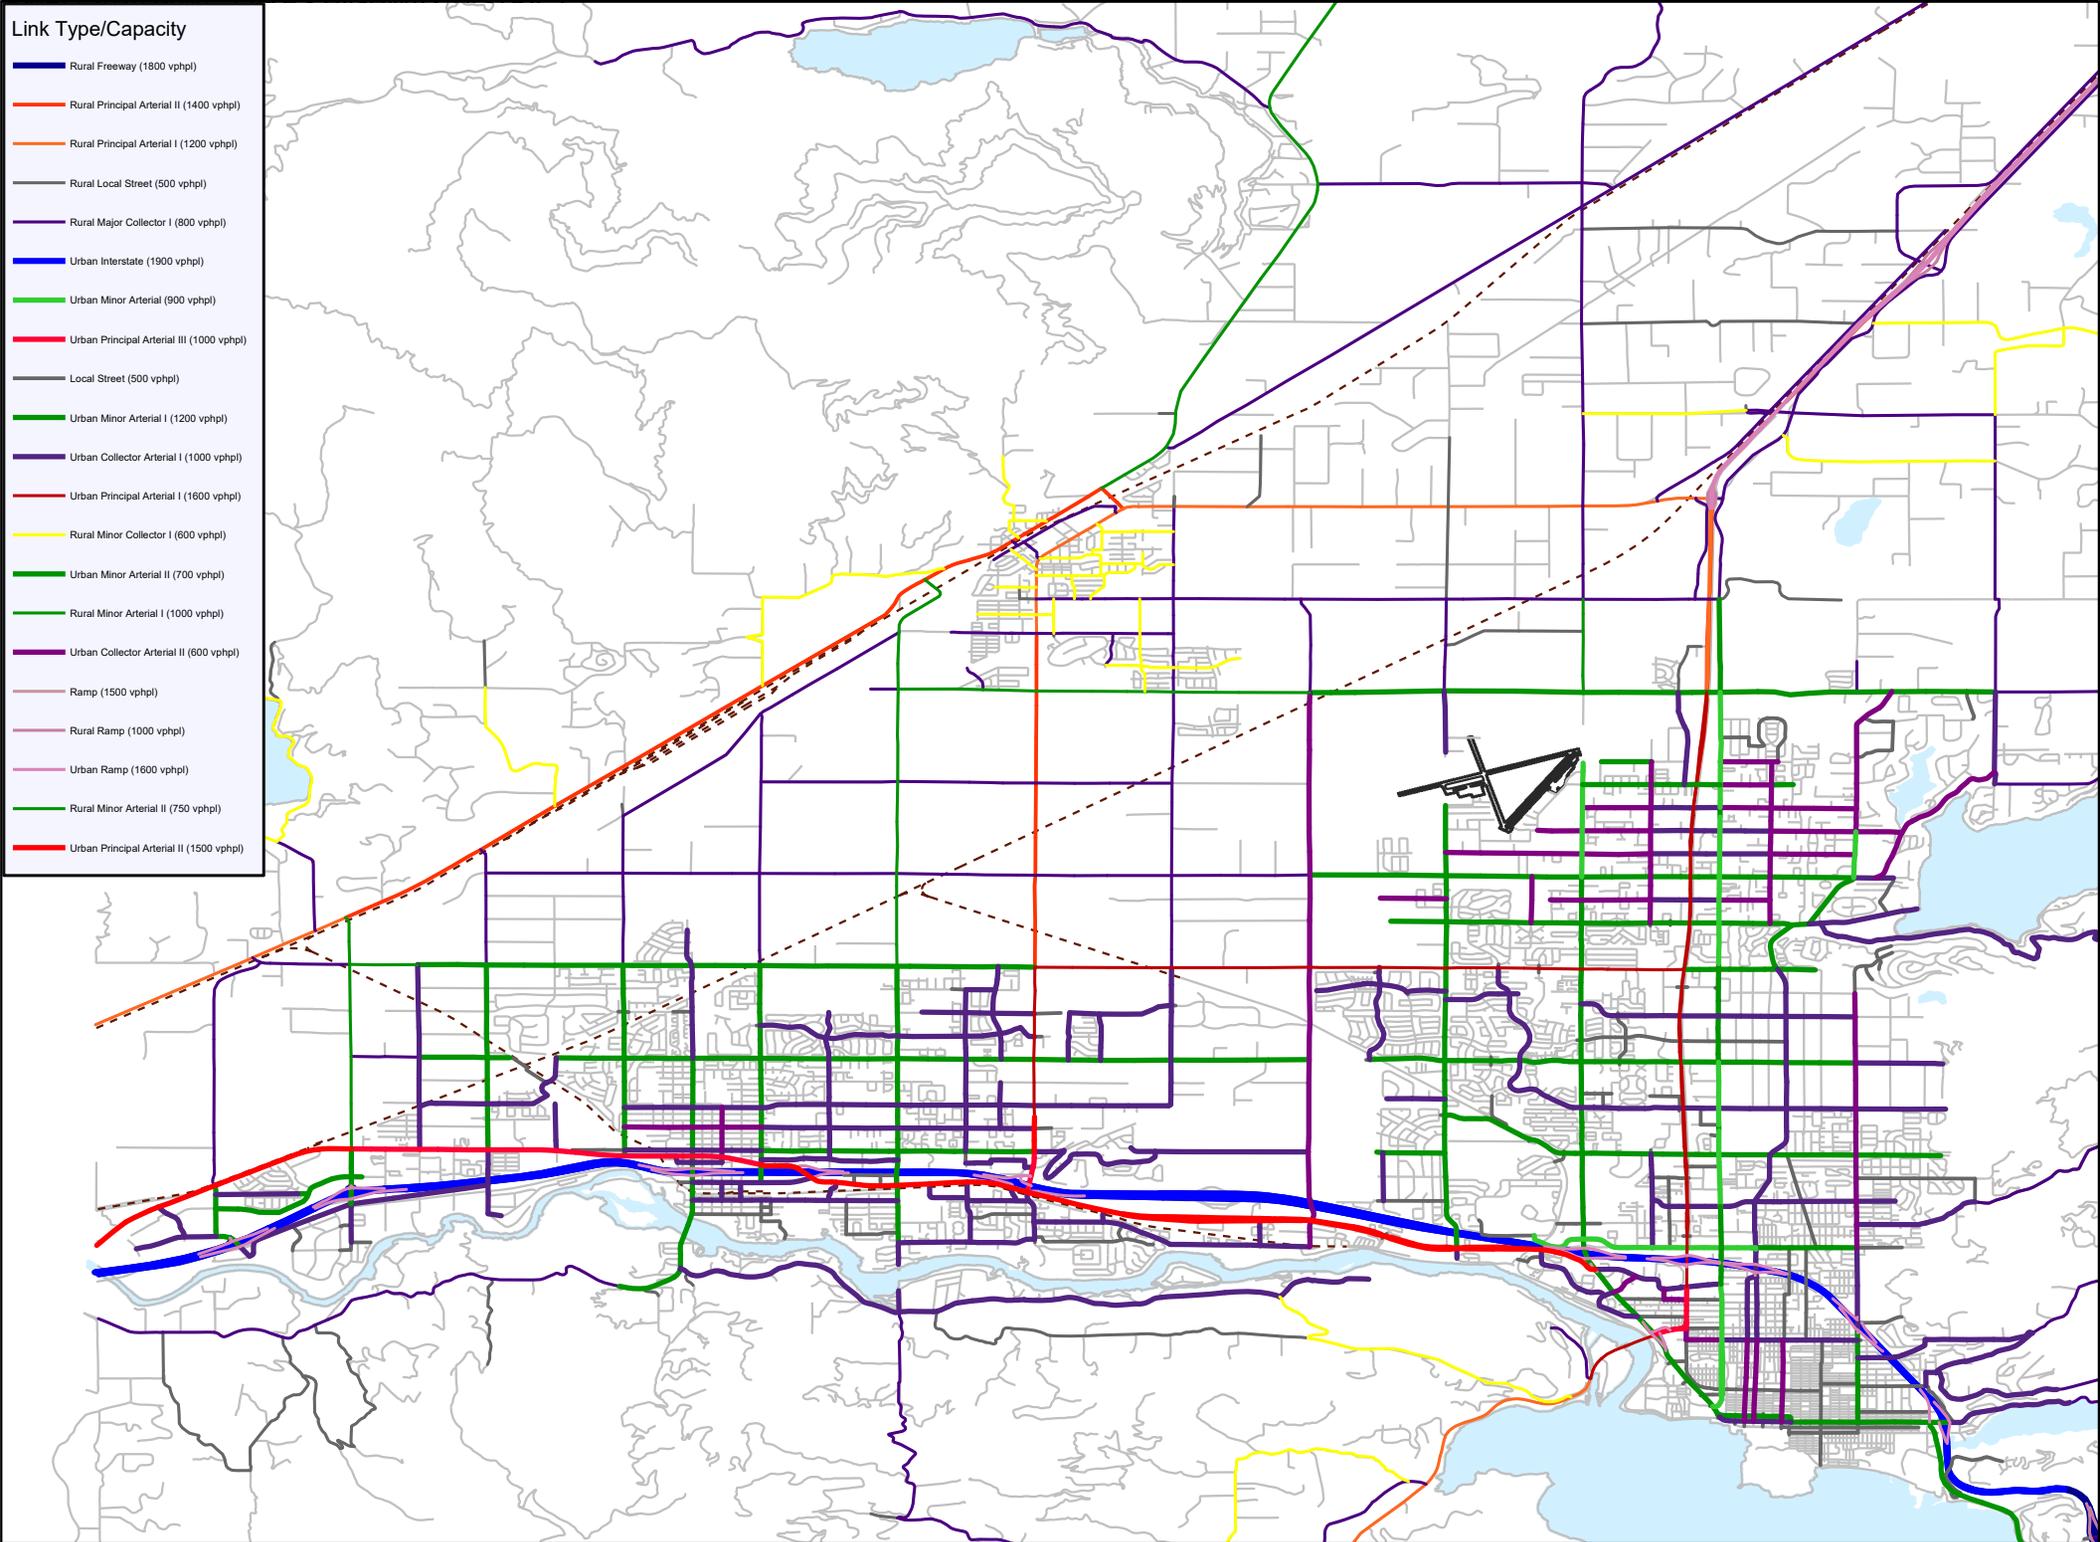

‘Link Length’ is the distance between the starting and ending nodes of the link. Link length is automatically calculated based on the network geometry.

Link attributes were checked during the 2020 update process and revisions made where appropriate. New facilities and other projects that altered roadway conditions were also added to ensure the model was consistent with 2020 conditions. Figures 2-4 illustrate the link attributes as assigned in the model for the urban area.

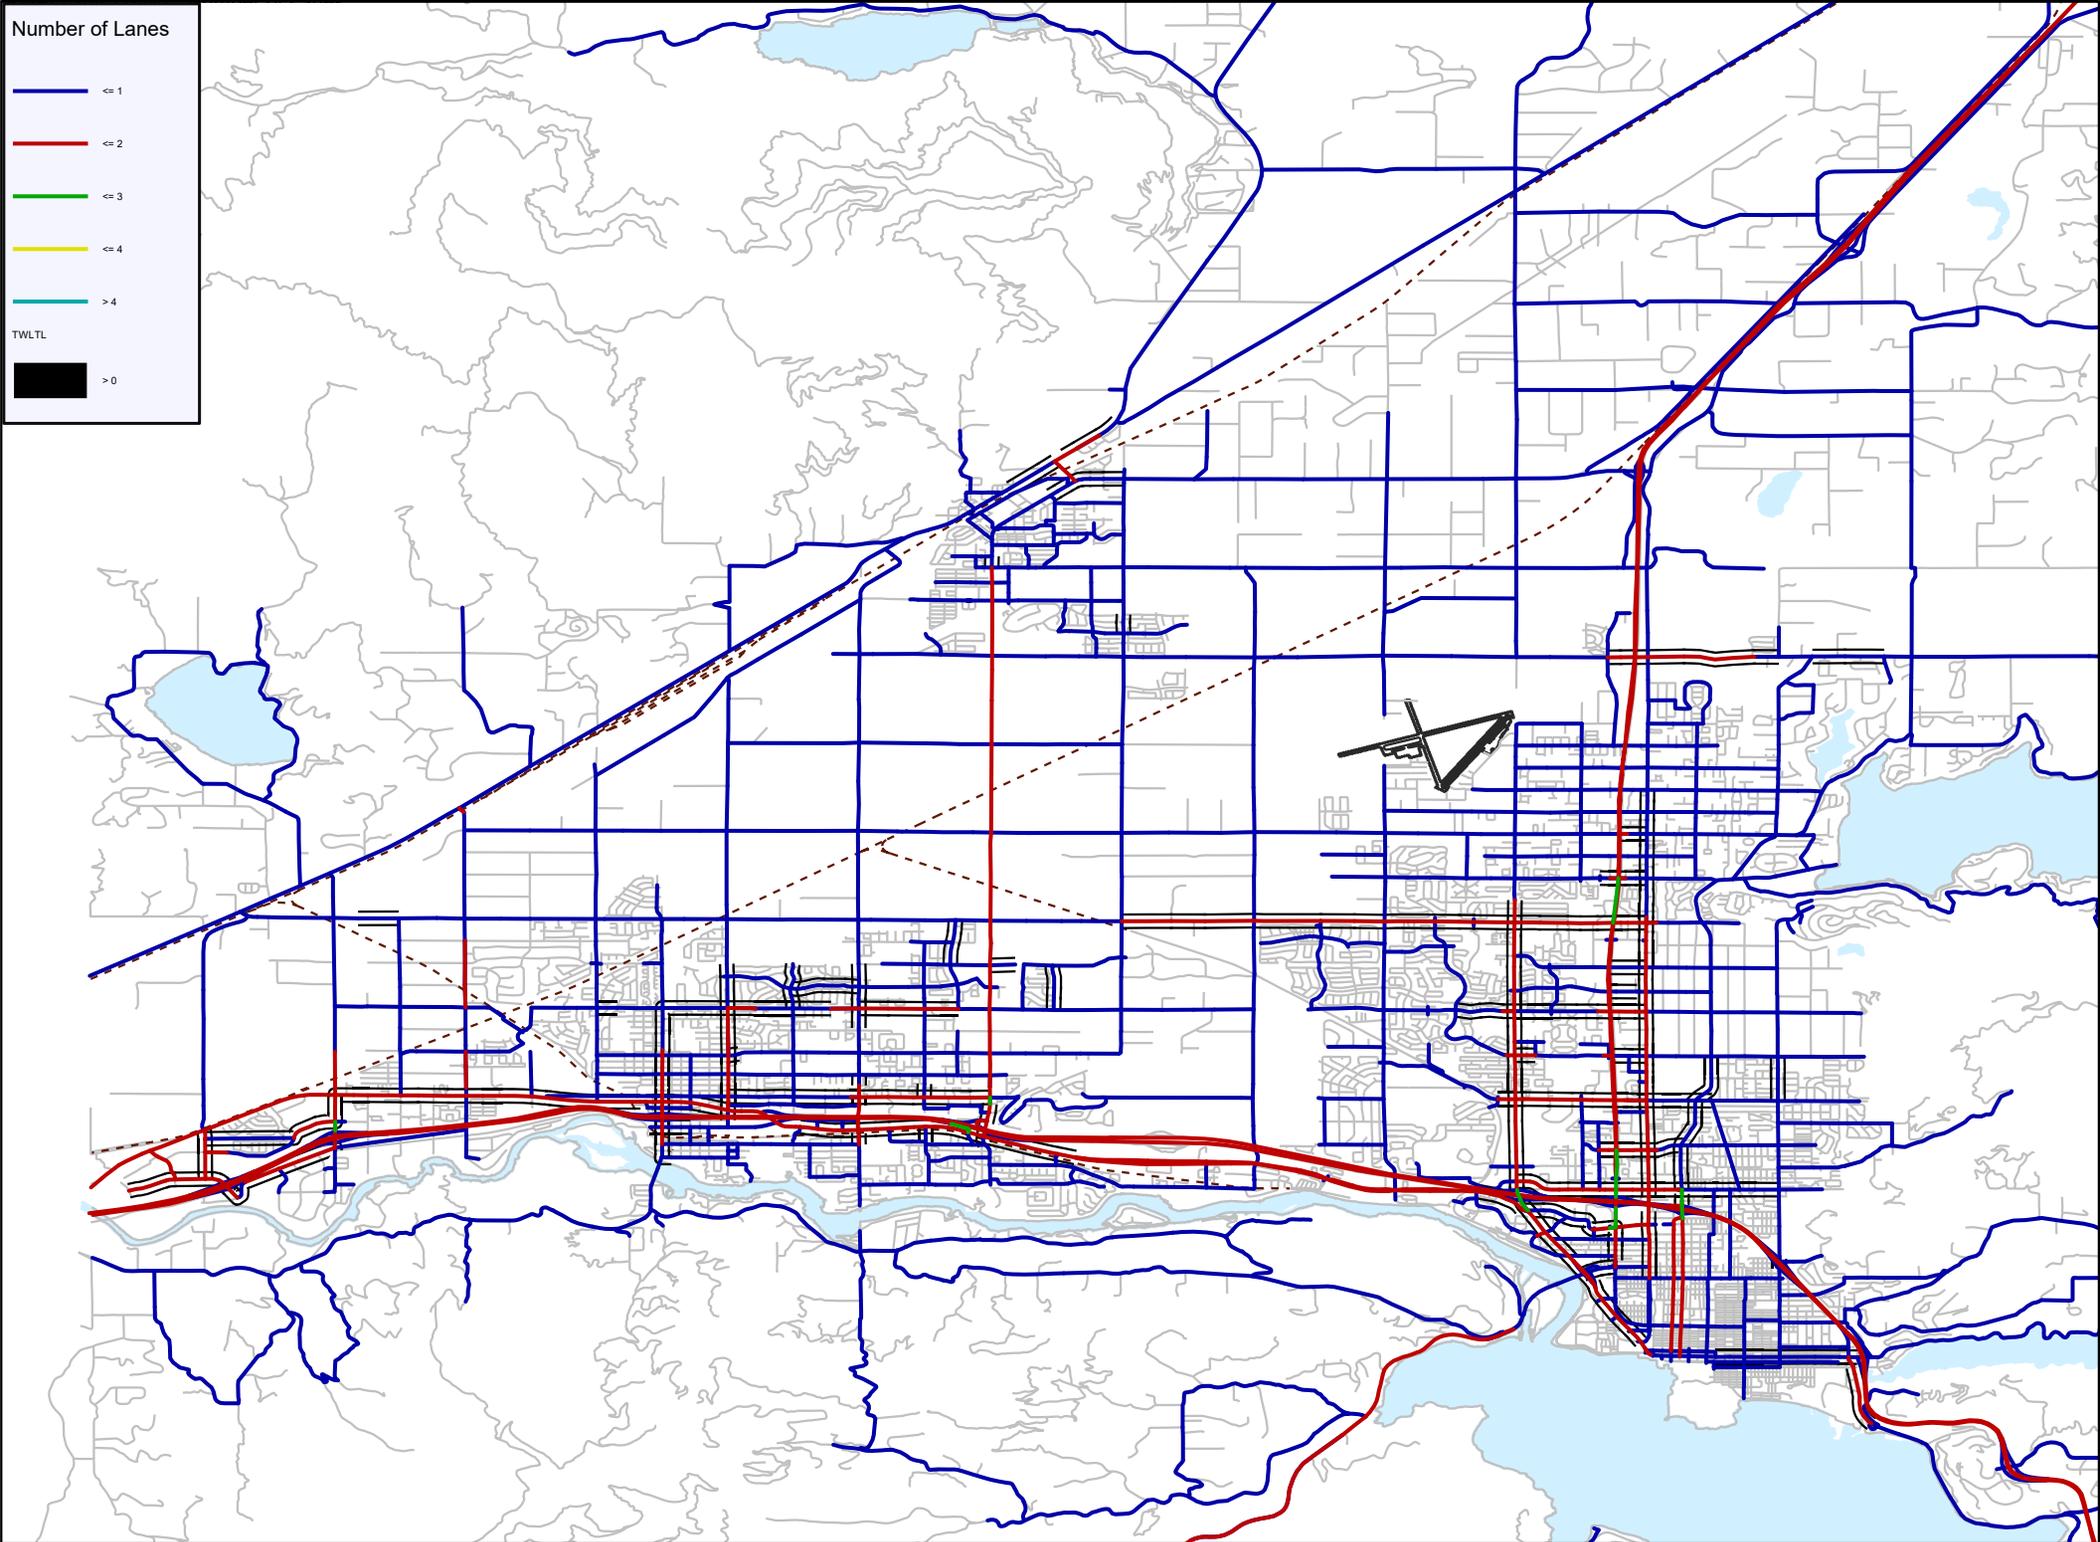

### 2.1.1 Link Traffic Count Update

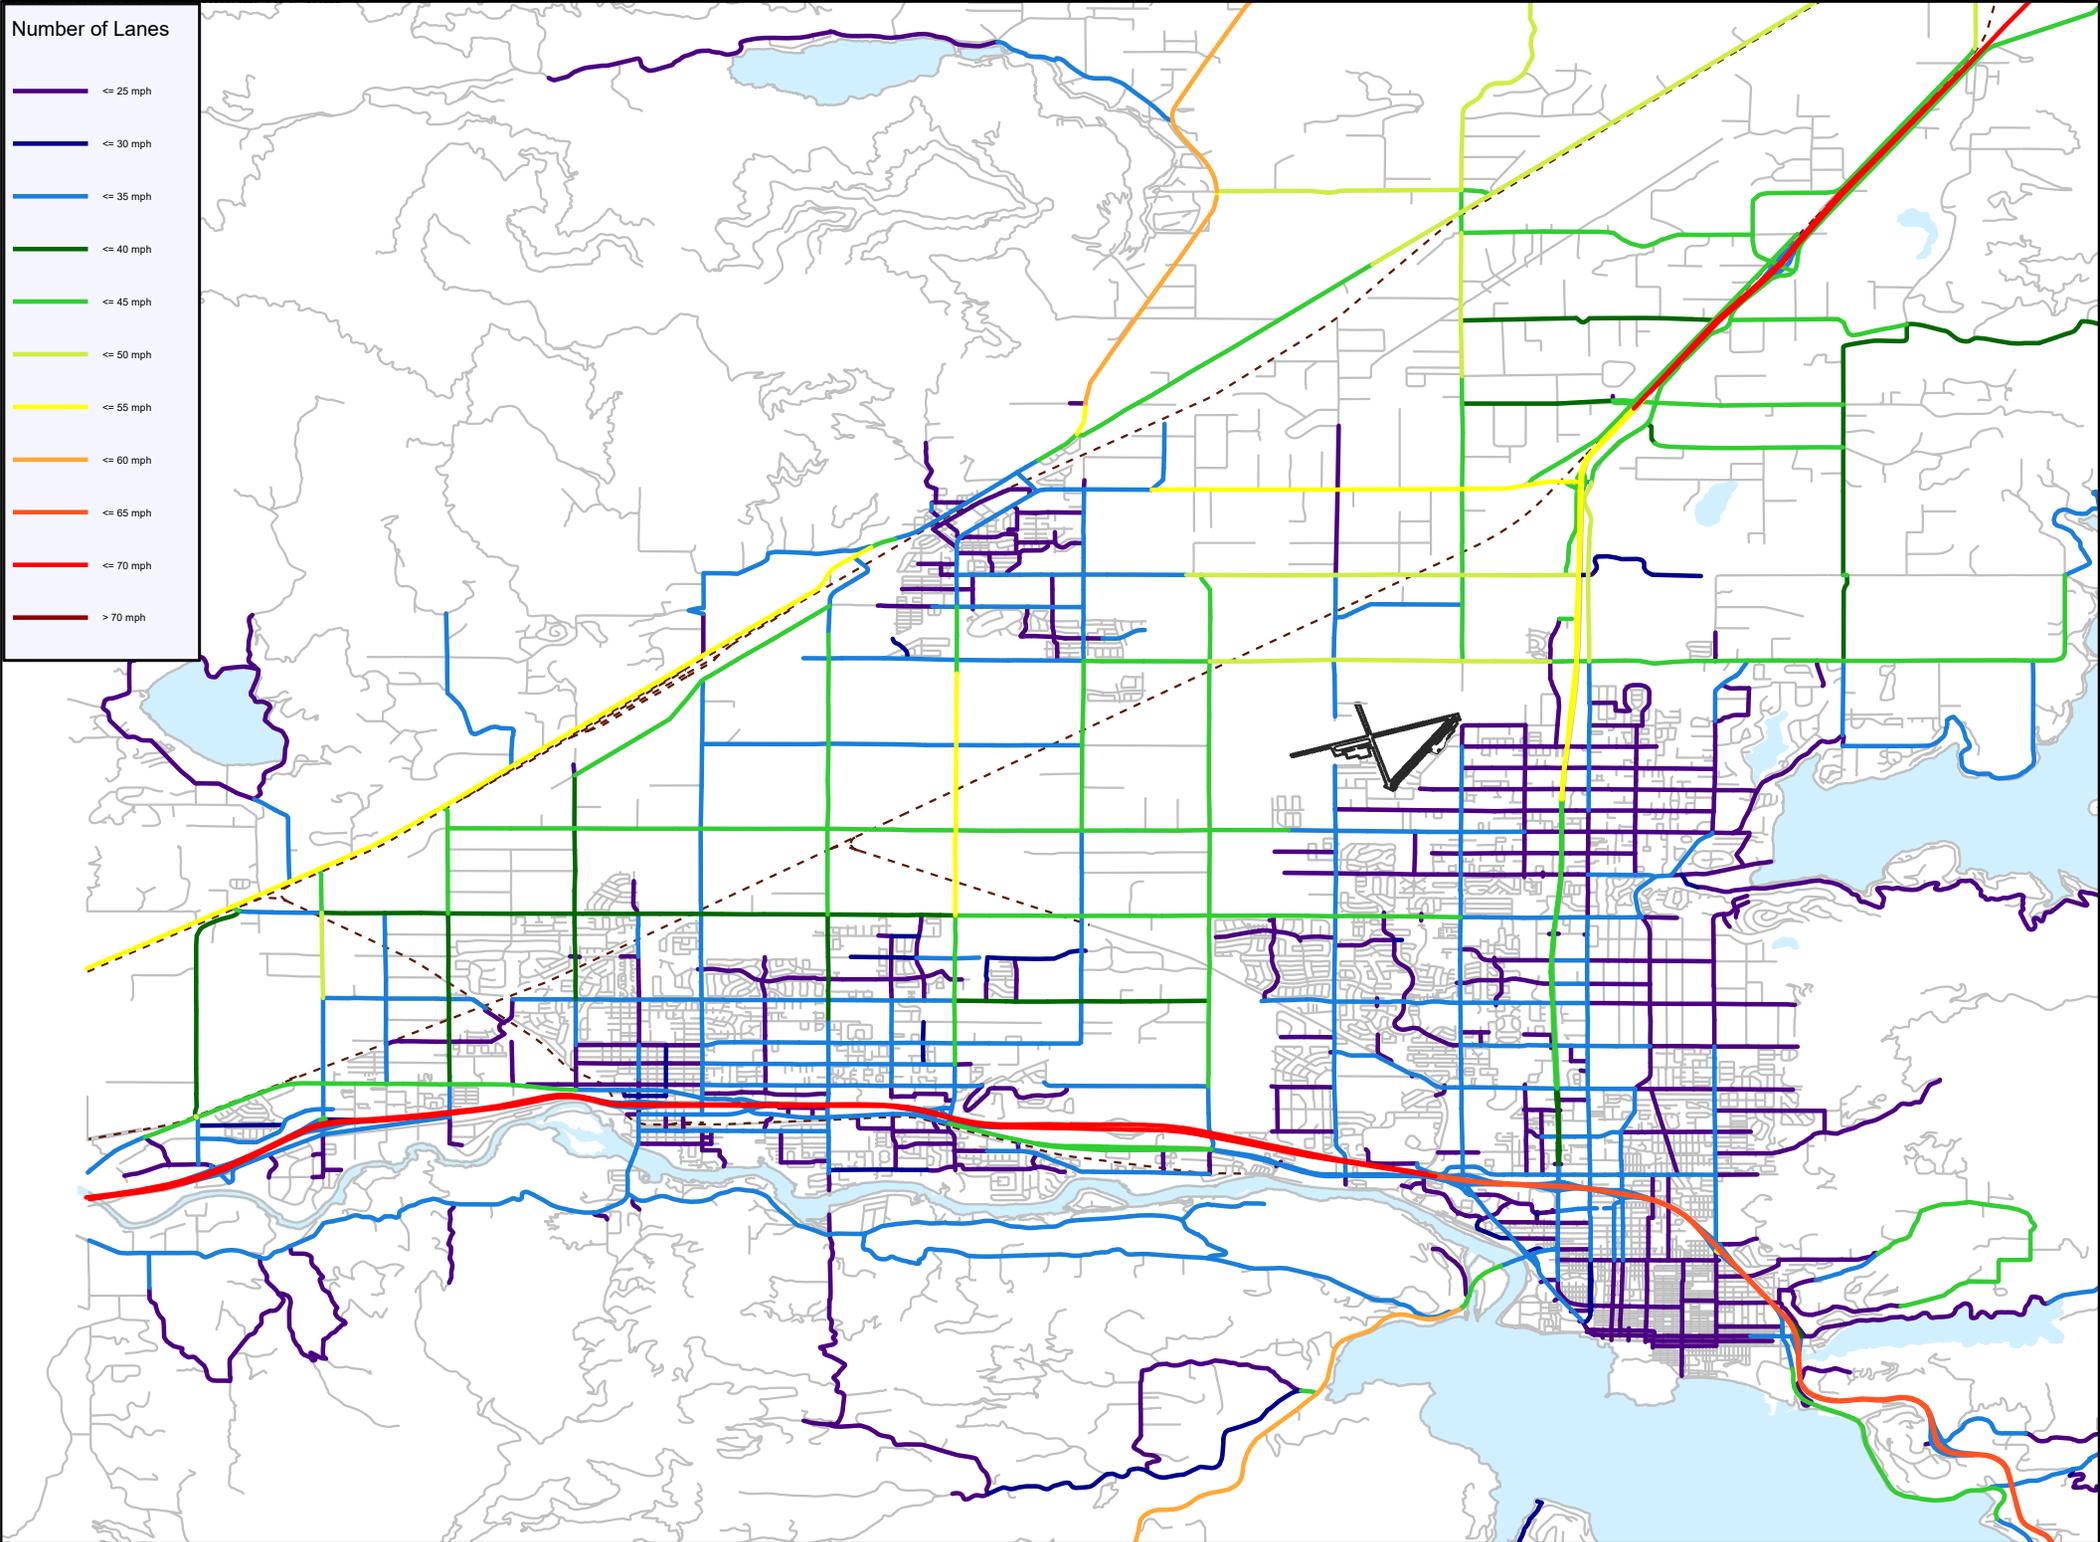

The 2020 AM and PM peak hour traffic counts were coded into the KMPO model for the purpose of model validation. The KMPO model has 313 desired count locations along its 28 screenlines. For 2020, data was available for 204 locations for the AM Peak Hour and 216 locations for the PM Peak Hour. Counts collected during the winter and summer months were adjusted to reflect typical peak volumes, using seasonal adjustment factors derived from ITD’s Automatic Traffic Recorder (ATR) data. Count data was used from collection years 2018-2023, except for 2020 due to large variations caused by COVID-19 disruptions. During the model validation, regression analyses are directly performed by using the model volumes to compare with the peak hour traffic counts.

Traffic counts used for the validation are included in Appendix B.

2020 Base Model

2020 Base Model

## 2.2 Intersection Nodes

Intersections are coded in the model as nodes. The KMPO model has multiple node types to represent different intersection controls and their distinct attributes. Attribute data used for nodes include node type, capacity and delay factors. A node must be coded in the model with both a node type and a VISUM control type, which assists in the calculation of performance indicators, such as level of service (LOS). Table 3 lists the model's node control types, and Table 4 lists the node (intersection) types.

**Table 2: Node Control Type**

Control Type	Description
0	Unknown
1	Uncontrolled
2	Two-Way Stop
3	Yield
4	Signalized
5	Roundabout

**Table 3: Node (Intersection) Types**

No.	Description
1	Shape Nodes
2	Centroid Connector Intersection
5	Ramp Diverge (K1=1500)
6	Ramp Merge (K1=1)
7	At-grade RR Crossing (UPRR 5-7 trains/day)
8	At-grade RR Crossing (BNSF up to 70 trains/day)
9	At-grade RR Crossing (Spur line several trains/week)
10	All-way Stop
11	Partial Stop
12	Yield
13	Uncontrolled
20	Signalized
21	Roundabout
22	Pedestrian Only signal or mid-block crosswalk with high volumes
99	Future Intersections

Node capacity factors are used to compute the overall capacity of the node, which is in turn used in computing the intersection delays. The equation used in the KMPO model for node capacity, in vehicles per hour, is:

$$C = K_1 + K_4 * (\text{Ent. Cap.})$$

where:

*C* = Capacity

*K<sub>1</sub>* = Capacity Constant added or subtracted in computation

*K<sub>4</sub>* = Capacity Factor multiplied by sum of entering link capacities

*Ent. Cap.* = Sum of entering capacities from all links entering the node

Node capacities for this model use the *K<sub>1</sub>* and *K<sub>4</sub>* constants. *K<sub>4</sub>* is used to simulate the effect that a green time-to-cycle length (G/C) ratio has at an intersection. For modeling purposes, it was assumed that when like classes meet the G/C ratio is fairly even, and as the roadway meets lesser class roadways, the green time, or G/C ratio, increased on the major facility. This effect is reflected in the increasing values of the *K<sub>4</sub>* constant as

the difference in entering link classes is more disparate. The capacities work with the node delay coefficients to compute the delay at each intersection depending upon the total amount of entering traffic.

During the update process, network nodes were checked and revisions were made where appropriate. New or changes to intersection controls were also added to ensure the model was consistent with existing conditions. Additionally, node geometry and turning movement types were analyzed at all controlled intersections to ensure appropriate capacity and lane types were coded. Node geometry is a primary input for determining capacity and delay for signalized, all-way stop, and two-way stop control types.

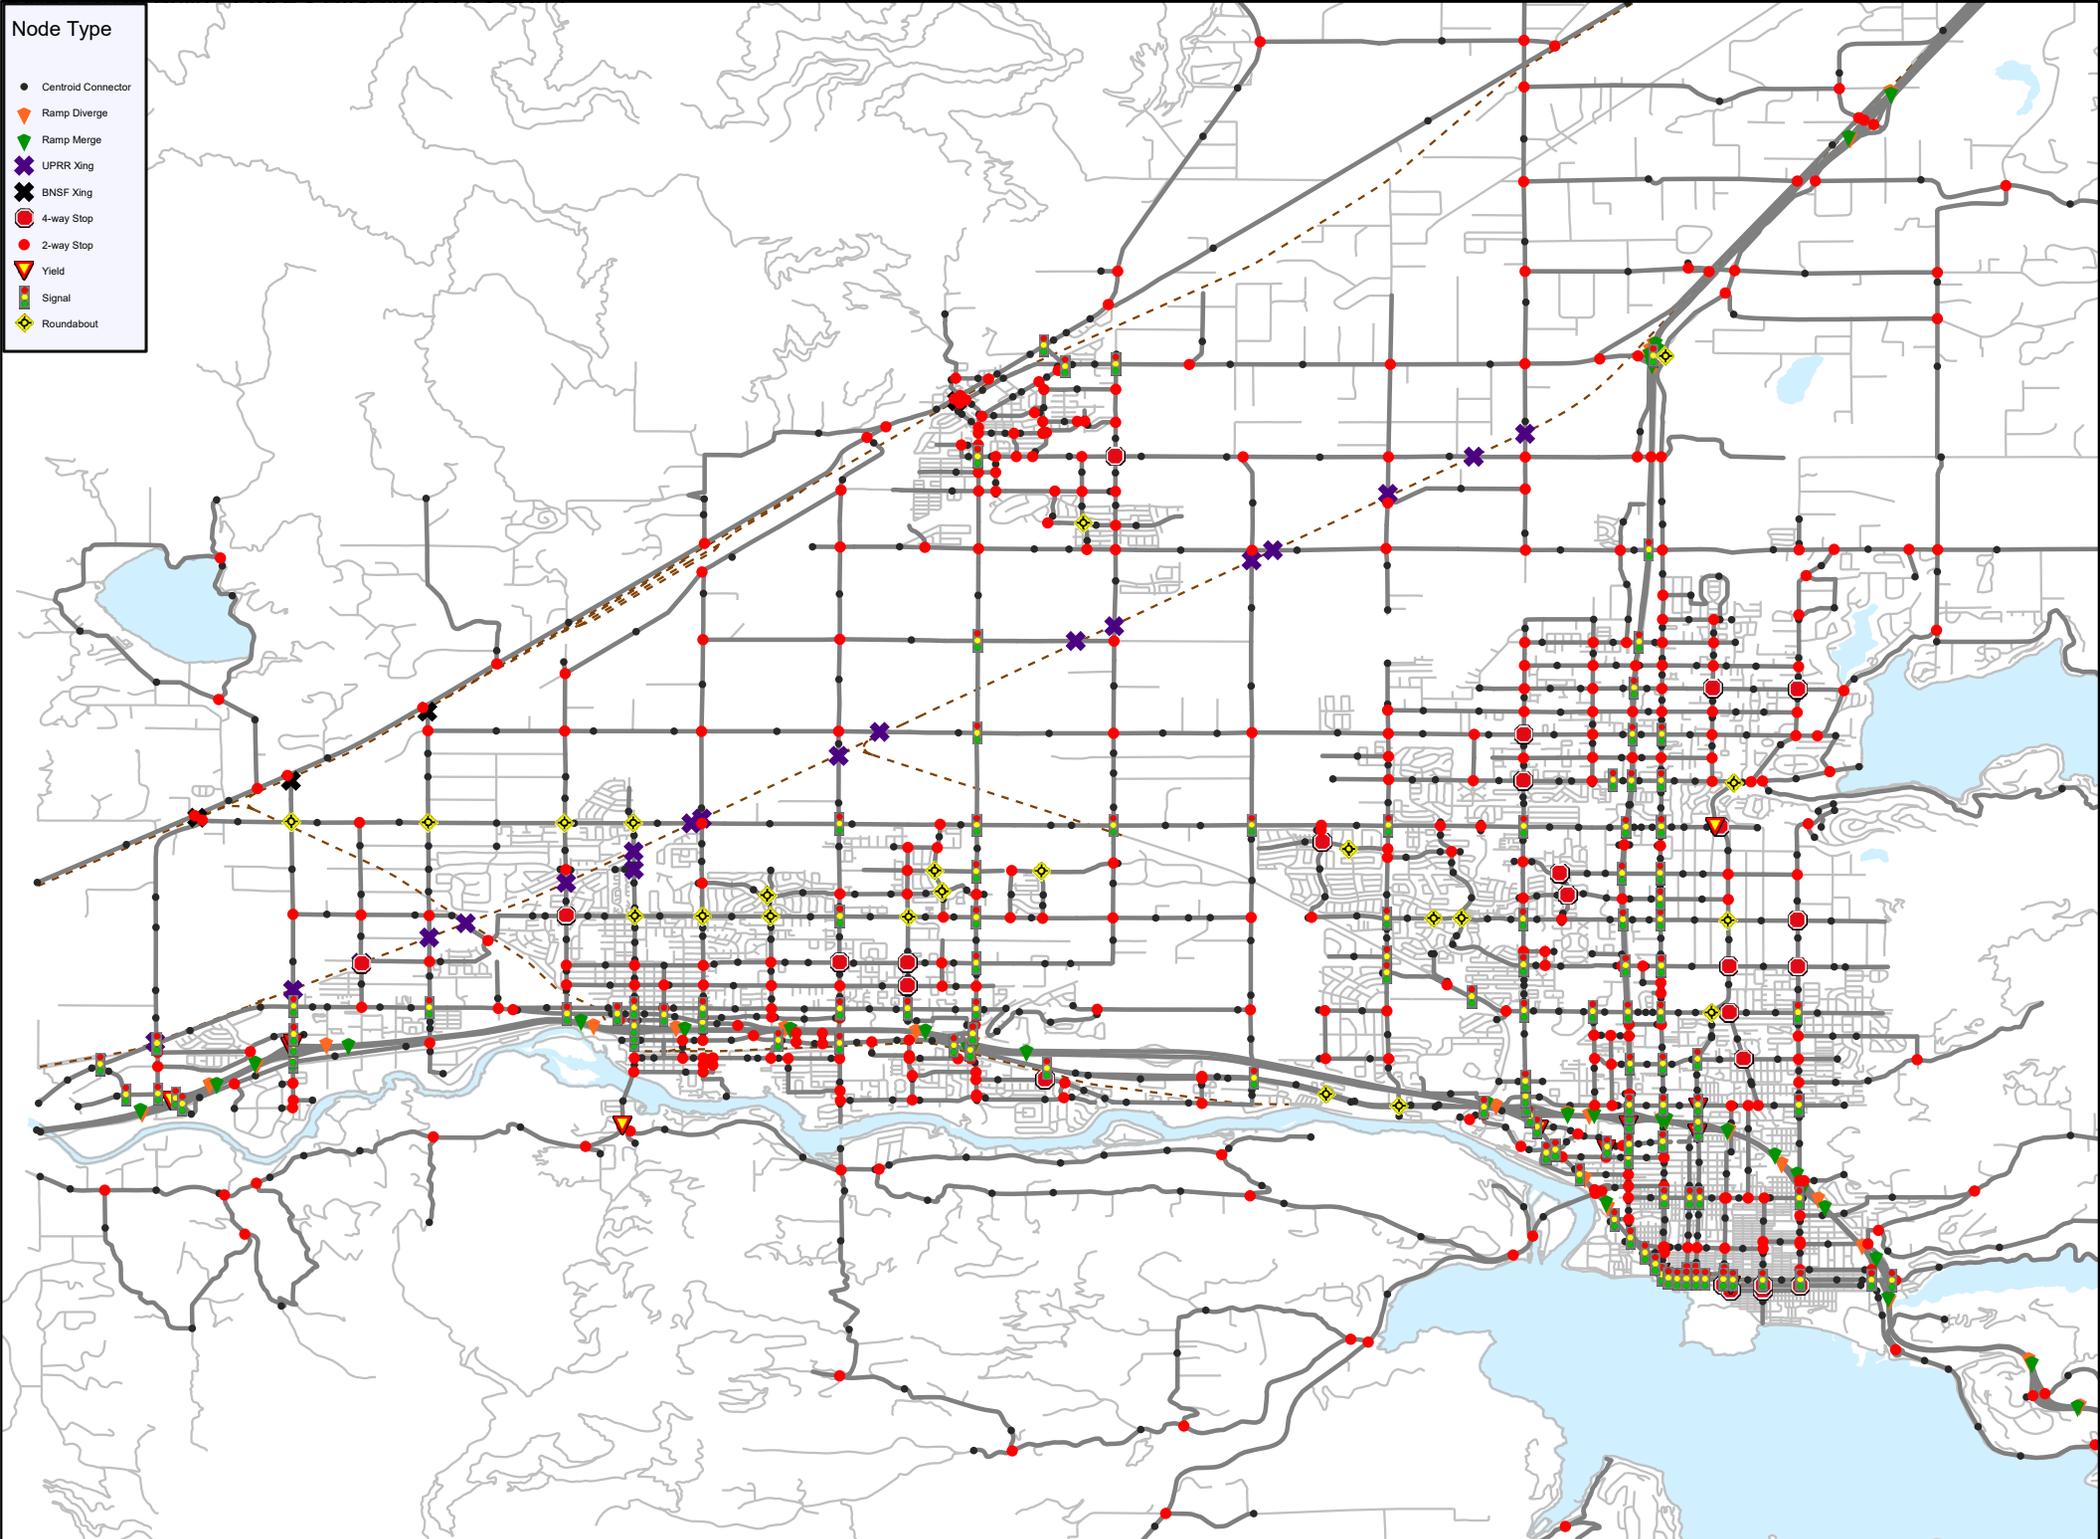

Figure 5 depicts the node types as assigned in the 2020 model for the urban area.

### 2.2.1. Railroad Crossing delay

In order to simulate the delay experienced at railroad crossings along the BNSF rail line, a post-assignment delay calculation was added in the procedure sequence, for both the AM and PM peak hours. Eight minutes of delay is added to type 8 nodes, which is factored into the overall vehicle miles and vehicle hours traveled. This delay was based on gate activation data provided by BNSF in 2018 and existing crossing location data from the Federal Railroad Administration (FRA), which estimates approximate two train crossings per hour with an average of 4 minutes per gate closure.

## 2.3 Centroid Connectors

Centroid connectors are the network objects that connect the zone centroids to the road network and vice versa, which is necessary for the assignment process. Connectors typically connect to the network at access points, such as driveways or local roads. The KMPO model distributes trips to and from the TAZs by shares. This allows the modeler to specify the weights of each connector, or what percent of the total trips in and out of the TAZ utilize that access point. This is helpful during the calibration process, as it allows for the weights to be adjusted, particularly if model volumes are not matching observed traffic counts. Connector weights were reviewed and revised based on count data and traffic loading pints.

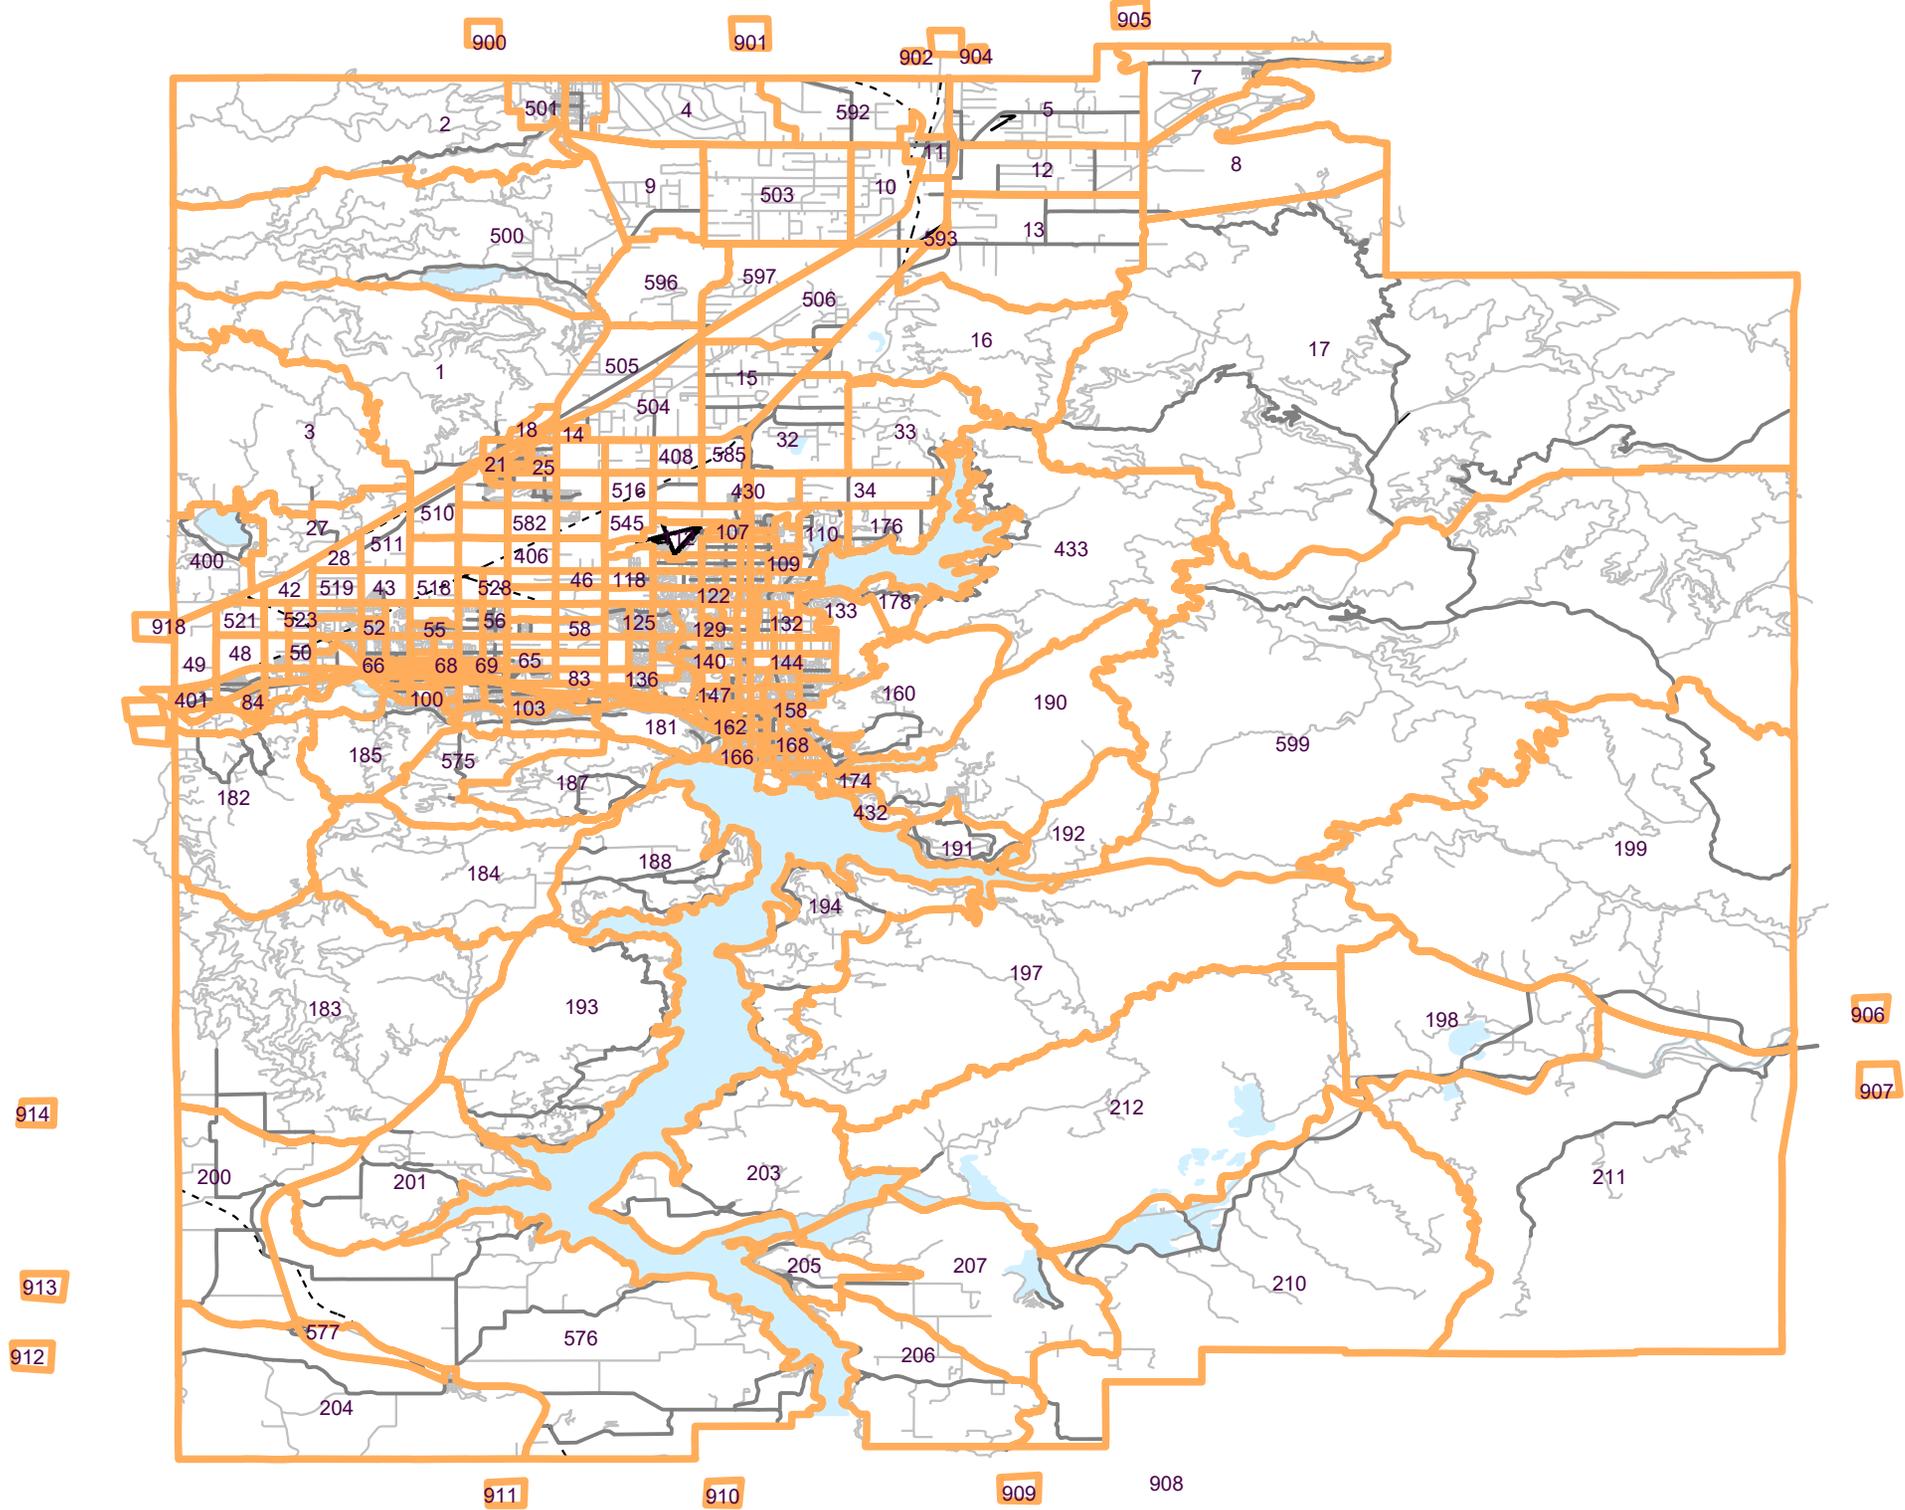

2020 Base Model

### 3.0 Traffic Analysis Zones

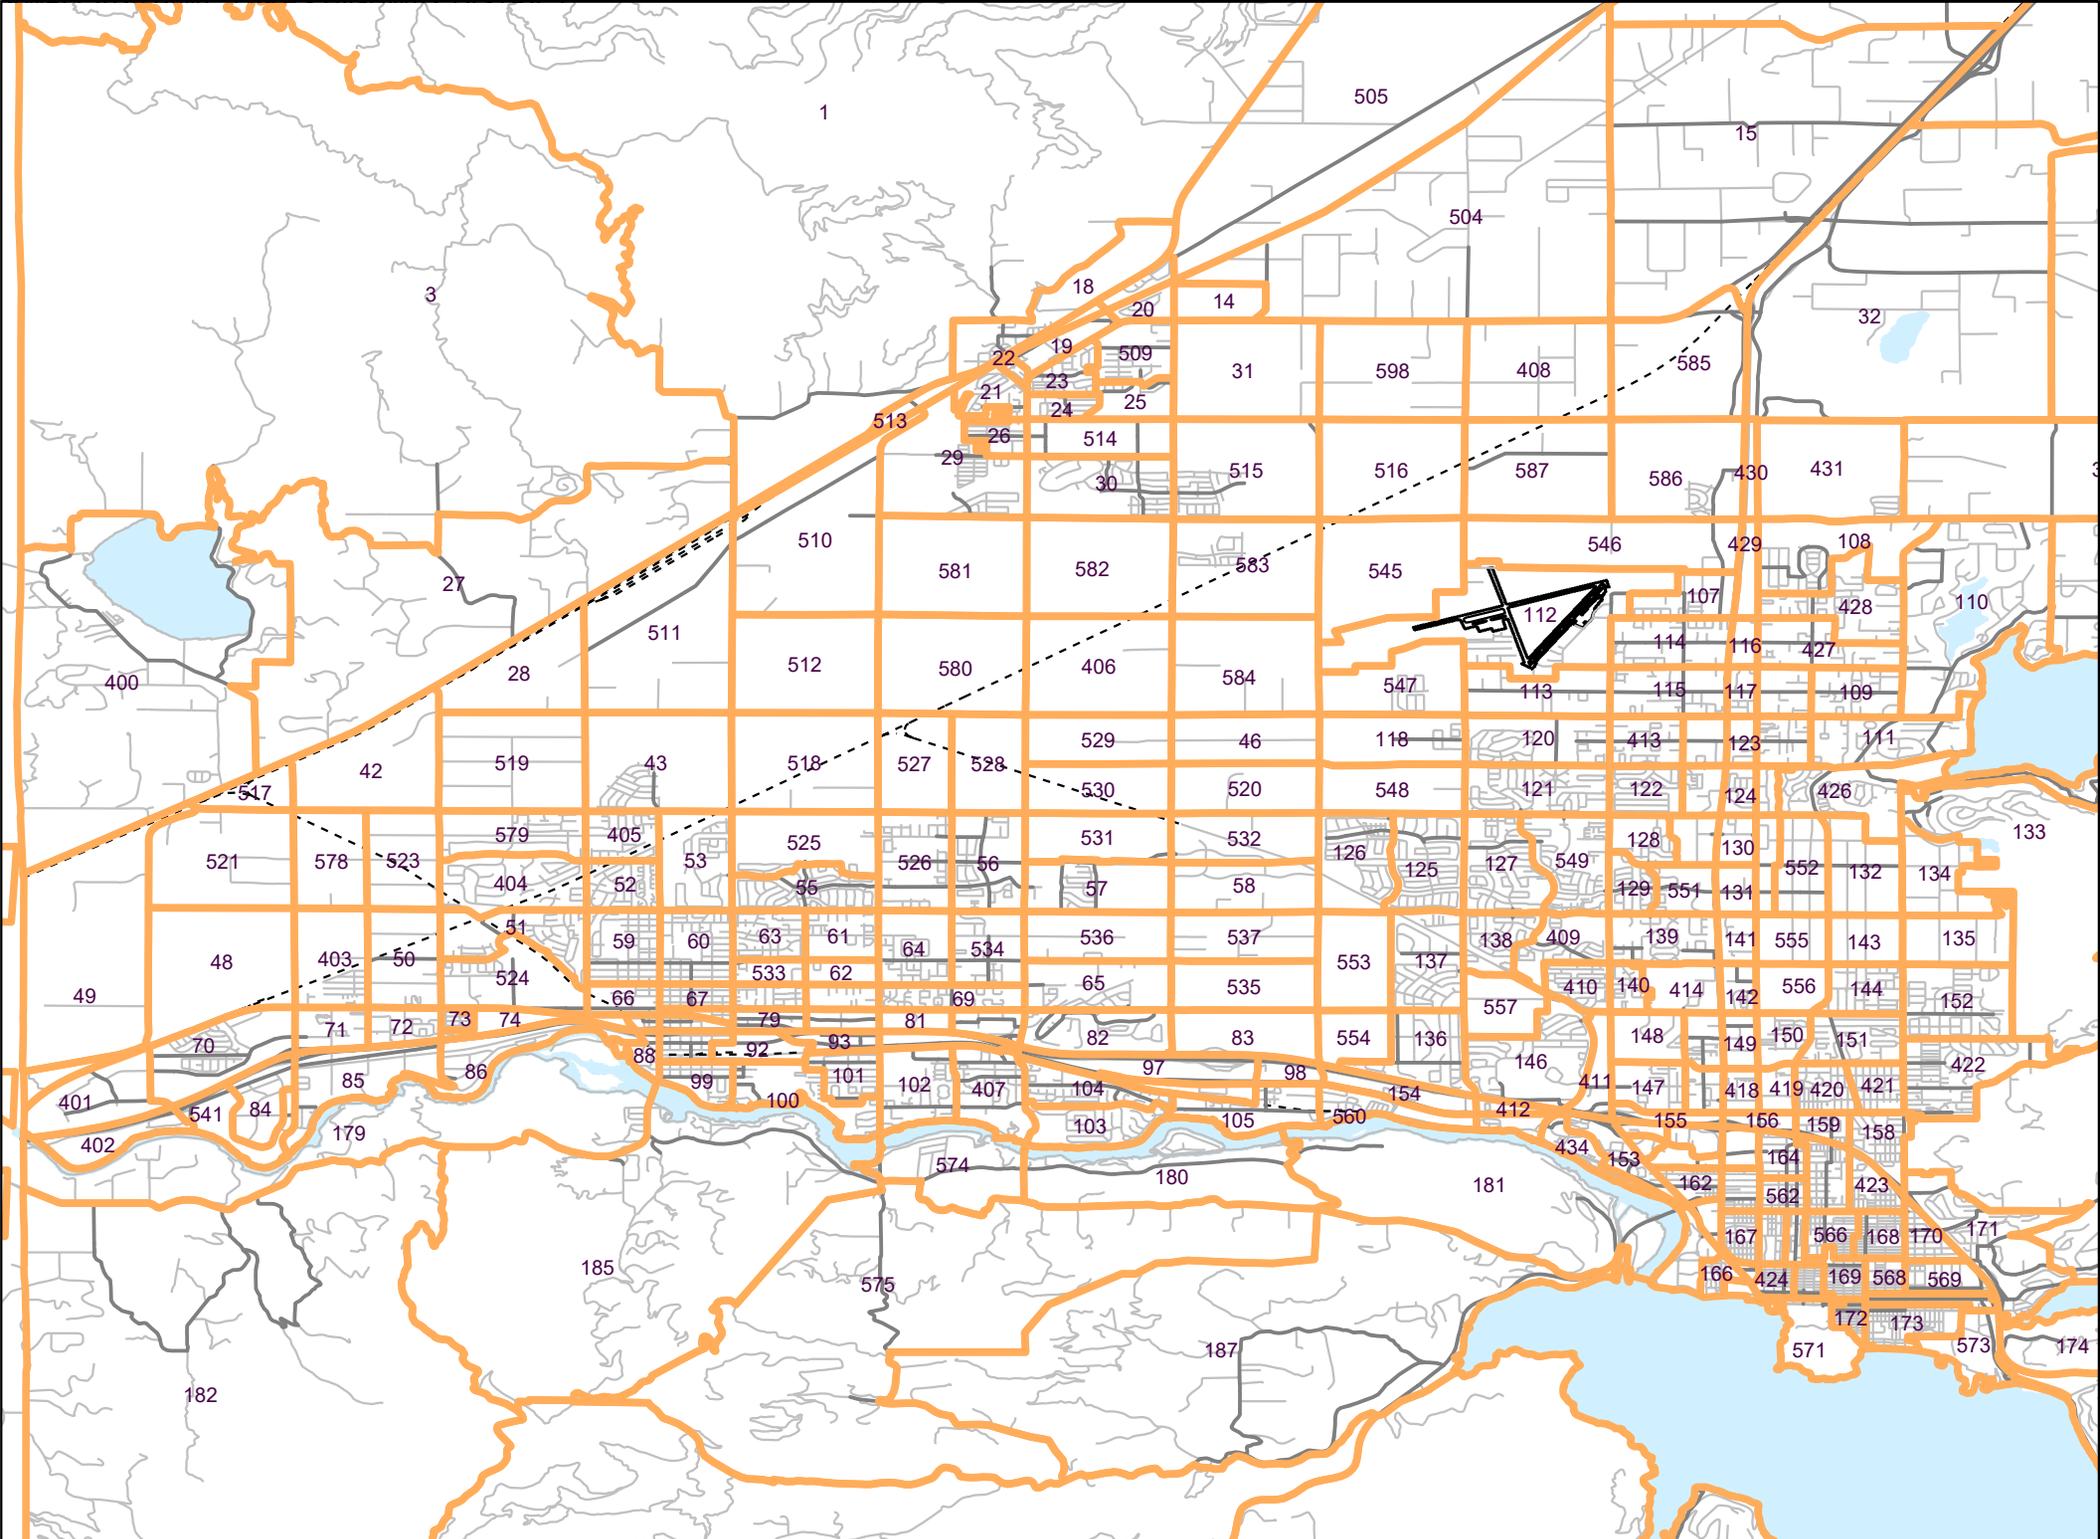

The model consists of 315 internal TAZs and 19 external TAZs. Internal zones are those within the boundaries of the model area, while external zones are located at roadways entering and leaving the model area. Internal TAZ boundaries are based off of the 2020 Census Blocks.

The points where all trips start and end in the model is the zone centroid, often located at the center of the TAZ or where the most highly concentrated development is located. Model trips generated in internal zones are based off of the land use data within each TAZ. However, external trips are based off of actual traffic counts collected at external stations.

Figures 6 and 7 shows the TAZ structure for the 2020 model.

2020 Base Model

2020 Base Model

### 3.1 Land Use

KMPO utilizes 23 land use categories to classify land use within the model based on NAICS codes. This allows KMPO to more easily match up to the Idaho DOL labor statistics for comparisons. The land use categories were adopted by the KMPO Board December 2018; no changes were made to the land use classifications during this update. Descriptions of the land use classifications are included in Table 4.

Land use data are important inputs to travel demand forecasting models because land uses generate travel activities and demands. To make accurate travel demand forecasts, modelers should strive to verify the accuracies of land use data in the traffic analysis zones (TAZ). KMPO staff took several rounds of land use reviews and verifications to reduce existing error in the land use data by TAZ.

**Table 4: KMPO Land Use Classifications**

<b>LU1 – (SFDU) Single Family Residential</b>	Lands occupied by a single-family home, duplex, or a manufactured home on a single lot. During calibration, this category was divided and single family uses in “outer zones” (outside of cities ACI’s) moved to Land Use category LU9 – Outer SFDU. LU1 is measured in single family dwelling units.
<b>LU2 – (MFDU) Multi-Family Residential</b>	Uses contain three or more residential units on a parcel of land. This category also includes mobile home parks, apartment buildings, and condominiums. LU2 is measured in multi-family dwelling units.
<b>LU3 – (RET) Retail</b>	Includes a broad range of establishments which sell goods directly to the general public, such as general commercial, home furnishings, food stores, direct selling establishments or other products. NAICS codes 441110 - 448320 & 451110 - 454390. LU3 is measured in employees.
<b>LU4 – (FIRES) Finance, Insurance, Real Estate Rental &amp; Leasing</b>	Includes Commercial banking, financing, investment brokers, savings institutions, credit unions, investment advice, insurance carriers, real estate, rental and leasing, passenger car rental, recreational rentals, commercial air rail and water transportation, video tape and disc rental and other related companies. NAICS codes 521110 – 525990 & 531110 - 533110. LU4 is measured in employees.
<b>LU5 – (INDUST) Industrial</b>	Includes Mining, Manufacturing and Wholesale sectors which comprises establishments engaged in the mechanical, physical, or chemical transformation of materials, substances, or components into new products. This also includes the wholesale trade sector which comprises establishments engaged in wholesaling merchandise, generally without transformation, and rendering services incidental to the sale of merchandise. The categories are mining operations, processing plants, packaging, mills, foundries, machining, wholesale goods merchants and wholesale trade agents and brokers. NAICS codes include 211111 – 213115, 311111 – 316998, 321113 – 327999, 331110 – 339999 & 423110 - 425120. LU5 is measured in number of employees.
<b>LU6 – (SCH) Schools</b>	Elementary and secondary schools. LU6 is measured in number of students, (manually derived).
<b>LU7 – (ACCOM) Accommodations</b>	All hotel and motel establishments. NAICS codes 721110 - 721214. Hotels, Motels, bed/breakfast inns and room/board houses. Measured by number of rooms (manually derived).
<b>LU8 – (AER) Arts, Entertainment and Recreation</b>	Includes theater companies and dinner theatres, musical groups and artists, sports teams and clubs, racetracks, museums, zoos, amusement and theme parks, casinos, marinas, golf courses, recreation centers, bowling centers, RV Parks and campgrounds and other amusement and recreation industries. NAICS codes 711110 - 713990. Measured by number of spaces (manually derived).
<b>LU9 – (OSFDU) Outer Single Family Residential</b>	Lands occupied by a single-family home, duplex, or a manufactured home on a single lot outside the cities ACI areas. Units from classification LU1 were moved to this category for zones 1-17, 182-185, 187, 188, 192-213, and 215. LU9 is measured in outer single-family dwelling units (rural).
<b>LU10 – (PSS) Post-Secondary School</b>	Colleges, Universities, Computer, Trade, and Other Professional Schools. LU10 is measured by number of students (manually derived).
<b>LU11 – (AGRI)</b>	NAICS code 111110 – 115310 and is measured in number of acres.

<b>Agriculture</b>	
<b>LU12 – (WFRT) Waterfront Units</b>	Dwelling units on the water such as houseboats. LU12 is measured in dwelling units. Not included in Land Use at this time (future).
<b>LU13 – (POL) Publicly-owned Land</b>	Land that is owned by the public, such as forest and BLM land. LU13 is measured in acres. KMPO used Kootenai County GIS parcel data to establish acreages within each TAZ area.
<b>LU14 – (TRNWH) Transportation &amp; Warehousing</b>	Includes the Postal Service, Couriers and express delivery services, local messengers and delivery, general, farm & refrigerated warehousing and storage. This category includes the Transportation and Warehousing sector which comprises industries providing transportation passengers and cargo, warehousing and storage for goods, scenic and sightseeing transportation, and support activities related to modes of transportation. NAICS codes 481111 – 488999 & 491110 - 493190. LU14 is measured in employees.
<b>LU15 – (MED) Medical</b>	Described as the Health Care and Social Assistance sector which comprises establishments providing health care and social assistance for individuals. NAICS codes 621111 - 624410 (Note: Kootenai Medical Center -KMC Employees are not reported under this section by DOL, but instead are under LU 16 Government). In the travel demand model, KMC employees will remain in LU 15 (MED) to maintain the same trip generation rates. LU15 is measured in number of employees.
<b>LU16 – (GOVT) Government</b>	Establishments of federal, state, and local government agencies that administer, oversee, and manage public programs and have executive, legislative, or judicial authority over other institutions within a given area (KMC medical employees are reported under this LU, by Idaho DOL), Measured in number of employees. NAICS codes 921110 – 928120.
<b>LU17 – (ASWMR) Administrative and Support and Waste Management and Remediation Services</b>	Includes office administrative services, temporary help services, telemarketing, collection agencies, visitors’ bureaus, locksmiths, landscaping services, solid waste collection, landfills, incinerators, septic tank services and related industries. Measured in number of employees. NAICS codes 561110 – 562998.
<b>LU18 – (PSTMC) Professional, Scientific &amp; Technical Services &amp; Management of Companies &amp; Enterprises</b>	Includes Offices of Notaries, Payroll services, testing laboratories, technical design services, outdoor advertising, etc. Measured in number of employees. NAICS codes 541110 – 541990 & 551111 – 551114.
<b>LU19 – (EDUSRV) Education Services</b>	Include support staff in elementary and secondary schools, junior colleges, business and secretarial schools, miscellaneous training schools and education support services. Measured in number of employees. NAICS codes 611110 – 611710.
<b>LU20 - OTHER Services (Except Public Administration</b>	Includes automotive repair, appliance repair and maintenance, diet centers, funeral homes, laundry services, photo finishing laboratories, religious organizations, civic and social organizations, business associations, political organizations, parking lots and garages and other miscellaneous services. NAICS codes 811111 – 814110. Measured in employees.
<b>LU21 – (INFO) Information</b>	Includes newspaper companies, software publishers, recording studios, radio stations, telecommunications and libraries. Measured in number of employees. NAICS codes 511110 – 519190.
<b>LU22 – (UTLCONST) Utilities &amp; Construction</b>	Includes power generation, transmission and distribution by: hydroelectric, fossil, solar, wind, geothermal, biomass, electric, gas and other. Also, includes water supply, steam and air-conditioning supply and sewage treatment facilities, construction of new homes, highway, street and bridge construction, contractors for: structural steel framing, roofing, siding, painting, flooring, site preparation and all other specialty trade contractors. NAICS codes 221111 – 221330 & 236115 - 238992. Measured in number of employees.
<b>LU23 – (FS) Food Services</b>	Includes caterers, mobile food services, full-service restaurants, drive-through, bars, cafeterias and buffets. NAICS codes 722110 – 722410 & 722511 - 722515, measured by number of employees.

### 3.1.1 Dwelling Unit Estimation

Data from the 2020 Census was used to estimate the number of occupied housing units within Kootenai County. The structure shapefile from Kootenai County was used to estimate the proportion of single and multi-family units per TAZ, as well as the split of single-family units inside and outside the cities’ ACIs.

### 3.1.2 2020 Land Use Summary

After KMPO staff updated the 2020 land use by TAZ, a control total check was made to ensure that the primary residential dwelling units matched the current and projected population totals. Table 5 is a summary of the 2020 land uses and totals obtained from the US Census, the Idaho Department of Labor and other sources manually obtained by KMPO staff through email correspondence, phone calls or the internet. Detailed land use data can be found in Appendix C.

**Table 5: 2020 KMPO Land Use Data Summary**

Land Use Type	Total 2020 Units	Units of Measurement
LU1: SFDU (Single Family Dwelling Units)	46,591	Dwelling Units
LU2: MFDU (Multi-Family Dwelling Units)	10,321	Dwelling Units
LU3: Retail	8,616	Employees
LU4: Commercial (FIRES)	3,095	Employees
LU5: Industrial	6,620	Employees
LU6: Schools	25,572	Students
LU7: Accommodations	2,993	Rooms
LU8: Arts, Entertainment & Recreation	7,695	Spaces
LU9: Reserved for Outer Zone SFDU	9,331	Dwelling Units
LU10: Post-Secondary Schools	3,316	Students
LU11: Agriculture	312,497	Acres
LU12: Waterfront Units	<i>Not Used</i>	Dwelling Units
LU13: Publicly-owned Lands	279,703	Acres
LU14: Transportation & Warehousing	1,096	Employees
LU15: Medical	10,752	Employees
LU16: Government	2,715	Employees
LU 17: Administration & Support	3,283	Employees
LU 18: Professional, Science & Technology	2,515	Employees
LU19: Educational Services	4,244	Employees
LU 20: Other Services	1,674	Employees
LU 21: Information	639	Employees
LU 22: Utilities & Construction	5,707	Employees
LU 23: Food Services	6,445	Employees

## 4.0 Trip Generation

Trip generation is the first step in the modeling process where a number of mathematical formulas determine how many trips are being produced or attracted by the model's TAZs. The number of trips is based off of the amount and type of land use in each TAZ. Each land use has unique trip generation rates that determine how many trips are produced and attracted in a TAZ based on the purpose of the trips.

The KMPO Model utilizes five different trip purposes, which allows for the gravity model to account for the different travel characteristics of each purpose. Those trip purposes are:

- Home-Based Work (HBW)
- Home-Based Retail (HBR)
- Home-Based Other (HBO)
- Home-Based School (HBS)
- Non-Home-Based (NHB)

## 4.1 INRIX Origin-Destination Update

Trip Analytics data was purchased from INRIX for the week of April 11-15, 2022. The data was provided in a csv. file format. PTV developed a Python script to assign model TAZs to the trip origin and destination locations. The script assigns values to the TAZ in order to identify trips as internal, external to internal (X-I), internal to external (I-X) or external to external (X-X). Two trip matrices were developed for the AM and PM peak hours. The data was used to update the X-X, I-X, and X-I data and cross-validate the productions and attractions between TAZs.

The ODME matrix from the previous model was removed in this update.

## 4.2 External TAZ Update

Nineteen external stations (TAZ 900 – TAZ 918) were used in the 2020 KMPO model to conceptually represent external TAZs. The external stations exist at the model borders and are used to simulate traffic entering and exiting the travel demand model. The trips coming from and to external areas are not based on the land use data for trip generation but, instead, are based on the existing directional traffic counts at the external stations. Actual traffic counts were used as a control total at each external TAZ station and then adjusted to correct the internal model matrices to match the counts. Most stations were updated with data from 2021-2022; however, at a few locations, data from 2017 was the most recent available. Counts were adjusted for seasonality based on ITD’s ATR seasonal factors.

Table 6 shows the adjusted counts at the X-I and I-X count locations for both the AM peak hour and PM peak hour time frames.

**Table 6: 2020 AM/PM Peak Hour Counts at External TAZs**

TAZ #	Location	IX-D-AM	IX-D-PM	XI-O-AM	XI-O-PM
900	State Hwy. 41 - N. County Line	138	215	30	84

	<b>TOTAL</b>	<b>3990</b>	<b>4740</b>	<b>3570</b>	<b>5108</b>

A travel demand model uses matrices to calculate the trip generation and distribution from a trip origin to a trip destination. Tables 7 and 8 show the internal AM and PM trip matrices that correspond to the external-to-external TAZs (travel beginning at one external TAZ and exiting at the other external TAZ location).

### 4.3 AM & PM Peak Hour Trip Generation Rates

The KMPO model’s trip generation rates are based off of rates developed by the Institute of Transportation Engineers (ITE). Variations of the trip rates were tested during the calibration process, and rates were adjusted in the model to produce balanced productions and attractions. Trip rates remain within ITE’s trip generation rate ranges for each land use type. Control totals from the “2005 Spokane and Kootenai County Regional Travel Survey Final Report” were used to validate the model results.

Table 9 includes the AM peak hour trip generation rates, and Table 10 shows the PM peak hour trip generation rates

#### 4.4 Trip Generation Validation

As stated previously, the KMPO VISUM model trip generation is categorized by five primary trip purposes. After the 2020 AM and PM peak hour trip generation model is run, the total number of KMPO region-wide trips are summarized to compare with the expanded travel survey samples reported in the “2005 Spokane and Kootenai County Regional Travel Survey Final Report.”

Tables 12 and 13 display the 2020 AM and PM Peak Hour trip generation model percentages results compared with the actual AM and PM Peak Hour trips as reported by NuStats in the 2005 Survey. Both the 2020 AM and PM Peak Hour model results show reasonable comparison with the 2005 Survey results as the percentage of modeled vehicle trips that exclude the external inbound, outbound, and through trips.

Table 11: 2020 AM Peak Hour Trip Generation Validation Results

TRIP PURPOSE	% AM PK HR of Modeled Trips	% AM PK HR of 2005 Trips Reported by NuStats	Difference	Total 2020 AM PK HR Trips
<i>Home Based Work</i>	25.1%	25.2%	-0.1%	14,268
<i>Home Based Retail</i>	6.4%	5.3%	1.1%	3,650
<i>Home Based Other</i>	29.1%	28.2%	0.9%	16,531
<i>Non-Home Based</i>	21.5%	20.7%	0.8%	12,211

<b>Total</b>	<b>100%</b>	<b>100%</b>		<b>73,775</b>

## 5.0 Trip Distribution

Trip Distribution is the second step of the Gravity Model process. This step in the process allocates trips between various TAZs, creating a set of trip tables that detail the number of trips between each TAZ for each trip purpose.

The Gravity Model, in transportation modeling, was derived from earlier work with economic interaction through a study of social physics. The basic idea behind the Gravity Model is that more interactions (between different zones) take place when the cost of interacting is less. As with the physics of gravitation between masses, it has been found that many human interactions can be related to the distance or cost between interactors using a negative exponential function. In essence, this means the higher cost or distance for travelers will result in less “gravitational pull” between TAZs.

### 5.1 Trip Distribution Parameters

The KMPO model utilizes the five primary trip purposes, discussed previously, for trip distribution. These trip purposes are based on Gravity Model functions. The a, b, and c parameters in the Gravity Model functions are calibrated in the 2020 KMPO model to fit the trip length distribution patterns in terms of frequencies and average travel times reported in the “2005 Spokane and Kootenai County Regional Travel Survey Final Report.” During the calibration process, PTV adjusted the trip distribution

dispersion parameters controlling average trip length for each demand strata to yield overall balance between model traffic and count data. The intrazonal skim time was also adjusted to have a value equal to one half of the average of the three nearest zones.

Tables 14 and 15 display the trip distribution parameters used in the 2020 model.

Table 13: Trip Distribution Utility Parameters AM PK HR

Trip Type	Trip Distribution Parameter		
	a	b	c
AM_H-O	0	2.4	0
AM_H-R	0	2.4	0
AM_H-S	0	2.6	0
AM_H-W	-0.1	1.7	5
AM_NHB	0	3.1	0
AM_O-H	0	2.4	0
AM_R-H	0	2.4	0
AM_S-H	0	2.6	0
AM_W-H	-0.1	1.7	5

Table 14: Trip Distribution Utility Parameters PM PK HR

Trip Type	Trip Distribution Parameter		
	a	b	c
PM_H-O	0	1.7	0
PM_H-R	0	1.8	0
PM_H-S	0	2.1	0
PM_H-W	-0.1	1.4	5
PM_NHB	0	2.1	0
PM_O-H	0	1.7	0
PM_R-H	0	1.8	0
PM_S-H	0	2.1	0
PM_W-H	-0.1	1.4	5

Figure 8, below, displays an example of the trip distribution direction parameter options that are used in the KMPO model trip distribution process. The trip distribution parameters differ by trip type, as described above, but the distribution options for function type, direction, trip balancing and feedback iterations are the same for all trip purposes. In the KMPO model, the trip distribution in the model is implemented as a doubly-constrained gravity model and uses the TModel functional form for friction factors.

Figure 8: KMPO Model Trip Distribution Parameter Options

## 5.2 Gravity Model Validation Results

A sampling of travel times from one traffic analysis zone (TAZ) to another was extracted from the model using flow bundles (Figure 9). The same path was input into Google Maps to estimate actual travel times during the AM peak and PM peak hours. It is important to note that the travel times via Google Maps are subject to change at any point due to actual roadway and traffic conditions. This may cause variations in route choice and travel time that differ from the model outputs. For comparison purposes, the model was run without the railroad delay procedures, since the delay represents the assumption travelers **will** be delayed at crossing locations and Google travel times do not.

As shown in Tables 16 and 17, the average model travel time roughly matches the average observed Google travel time for overall KMPO region-wide, despite some average travel time variations.

Table 15: 2020 AM Peak Hour Average Travel Time (Minutes) – 2020 Base Model Vs. Google Estimated Travel Times

O Zone	D Zone	From	To	Length	t0	tCur	Google TT	Difference

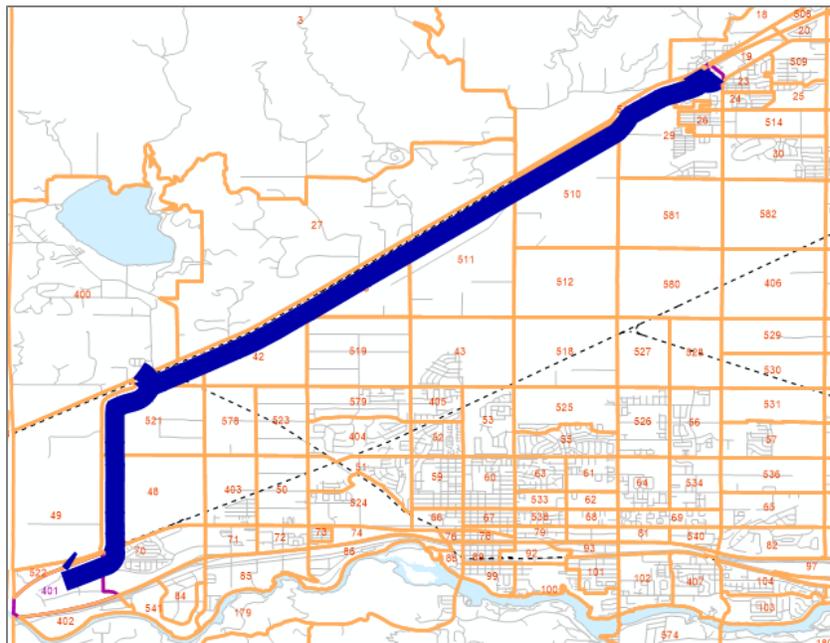

Figure 9: Example Model Flow Bundle to Calculate Travel

## 6.0 Trip Assignment

Trip Assignment is the final step of the KMPO modeling process. It is during this process that the distributed trips from the trip tables are assigned to possible paths between each zone. The assignment step uses equilibrium assignment methods (discussed below), which assigns traffic to each path between each zone such that the travel time for every path between OD pairs is statistically equal. This assumes that travelers will know the most efficient route between sets of origins and destinations, meaning they will select the shortest route. In reality, travelers choose routes based on their “perception” of travel time, which may be influenced by other factors. The model, however, uses travel time computed based on inputs described in the previous sections (i.e. speed, capacity, volumes, delay, etc.). The assignment process is iterative, in order to achieve convergence. Convergence is the point in which no vehicles can improve their route travel times.

The KMPO model uses two traffic assignment methods within the procedures. For the initial assignment run, the model utilizes the “Equilibrium Assignment” method. PTV recently updated the

Equilibrium method within VISUM to incorporate improvements, including faster run times with similar results to the Equilibrium Bi-conjugate Frank Wolfe method. “Equilibrium Assignment Bi-conjugate Frank Wolfe” is used in the second assignment run. This method produces more consistent route flows (i.e. proportionality for select link analysis) than the Equilibrium method alone.

**Table 17: Assignment Parameters**

Assignment Parameter	Value
Assignment Iterations	200
Assignment Convergence	0.0001
Trip Distribution Feedback Loops	Minimum of 2 Maximum of 5

## 6.1 Assignment Results

The 2020 AM peak hour KMPO Model traffic assignments are displayed in Figure 10 and the 2020 PM peak hour KMPO Model traffic assignments are displayed in Figure 11. The figures provide a snapshot of directional traffic volumes for the AM and PM peak hours in the urbanized KMPO area.

## 6.2 Assignment Validation

### 6.2.1 Screenline Analysis

Since the directional traffic forecasts need to be evaluated for statistical accuracy and confidence, screenline validation analysis is performed for both AM and PM peak hour conditions. As shown in Figures 8 and 9, twenty-eight screenlines are drawn to display ratios of the 2018 KMPO model AM and PM peak hour traffic modeled volumes over their corresponding traffic counts. Tables 19 and 20 summarize the screenline analysis results.

The closer the model/count ratios by screenlines approach 1.00, the better match the screenline traffic volumes are compared with the traffic counts. The Federal Highway Administration (FHWA) developed a maximum allowable screenline validation error range and formula as shown below:

#### **% Allowable Deviation per TMIP FHWA**

*For volumes less than 100,000:*

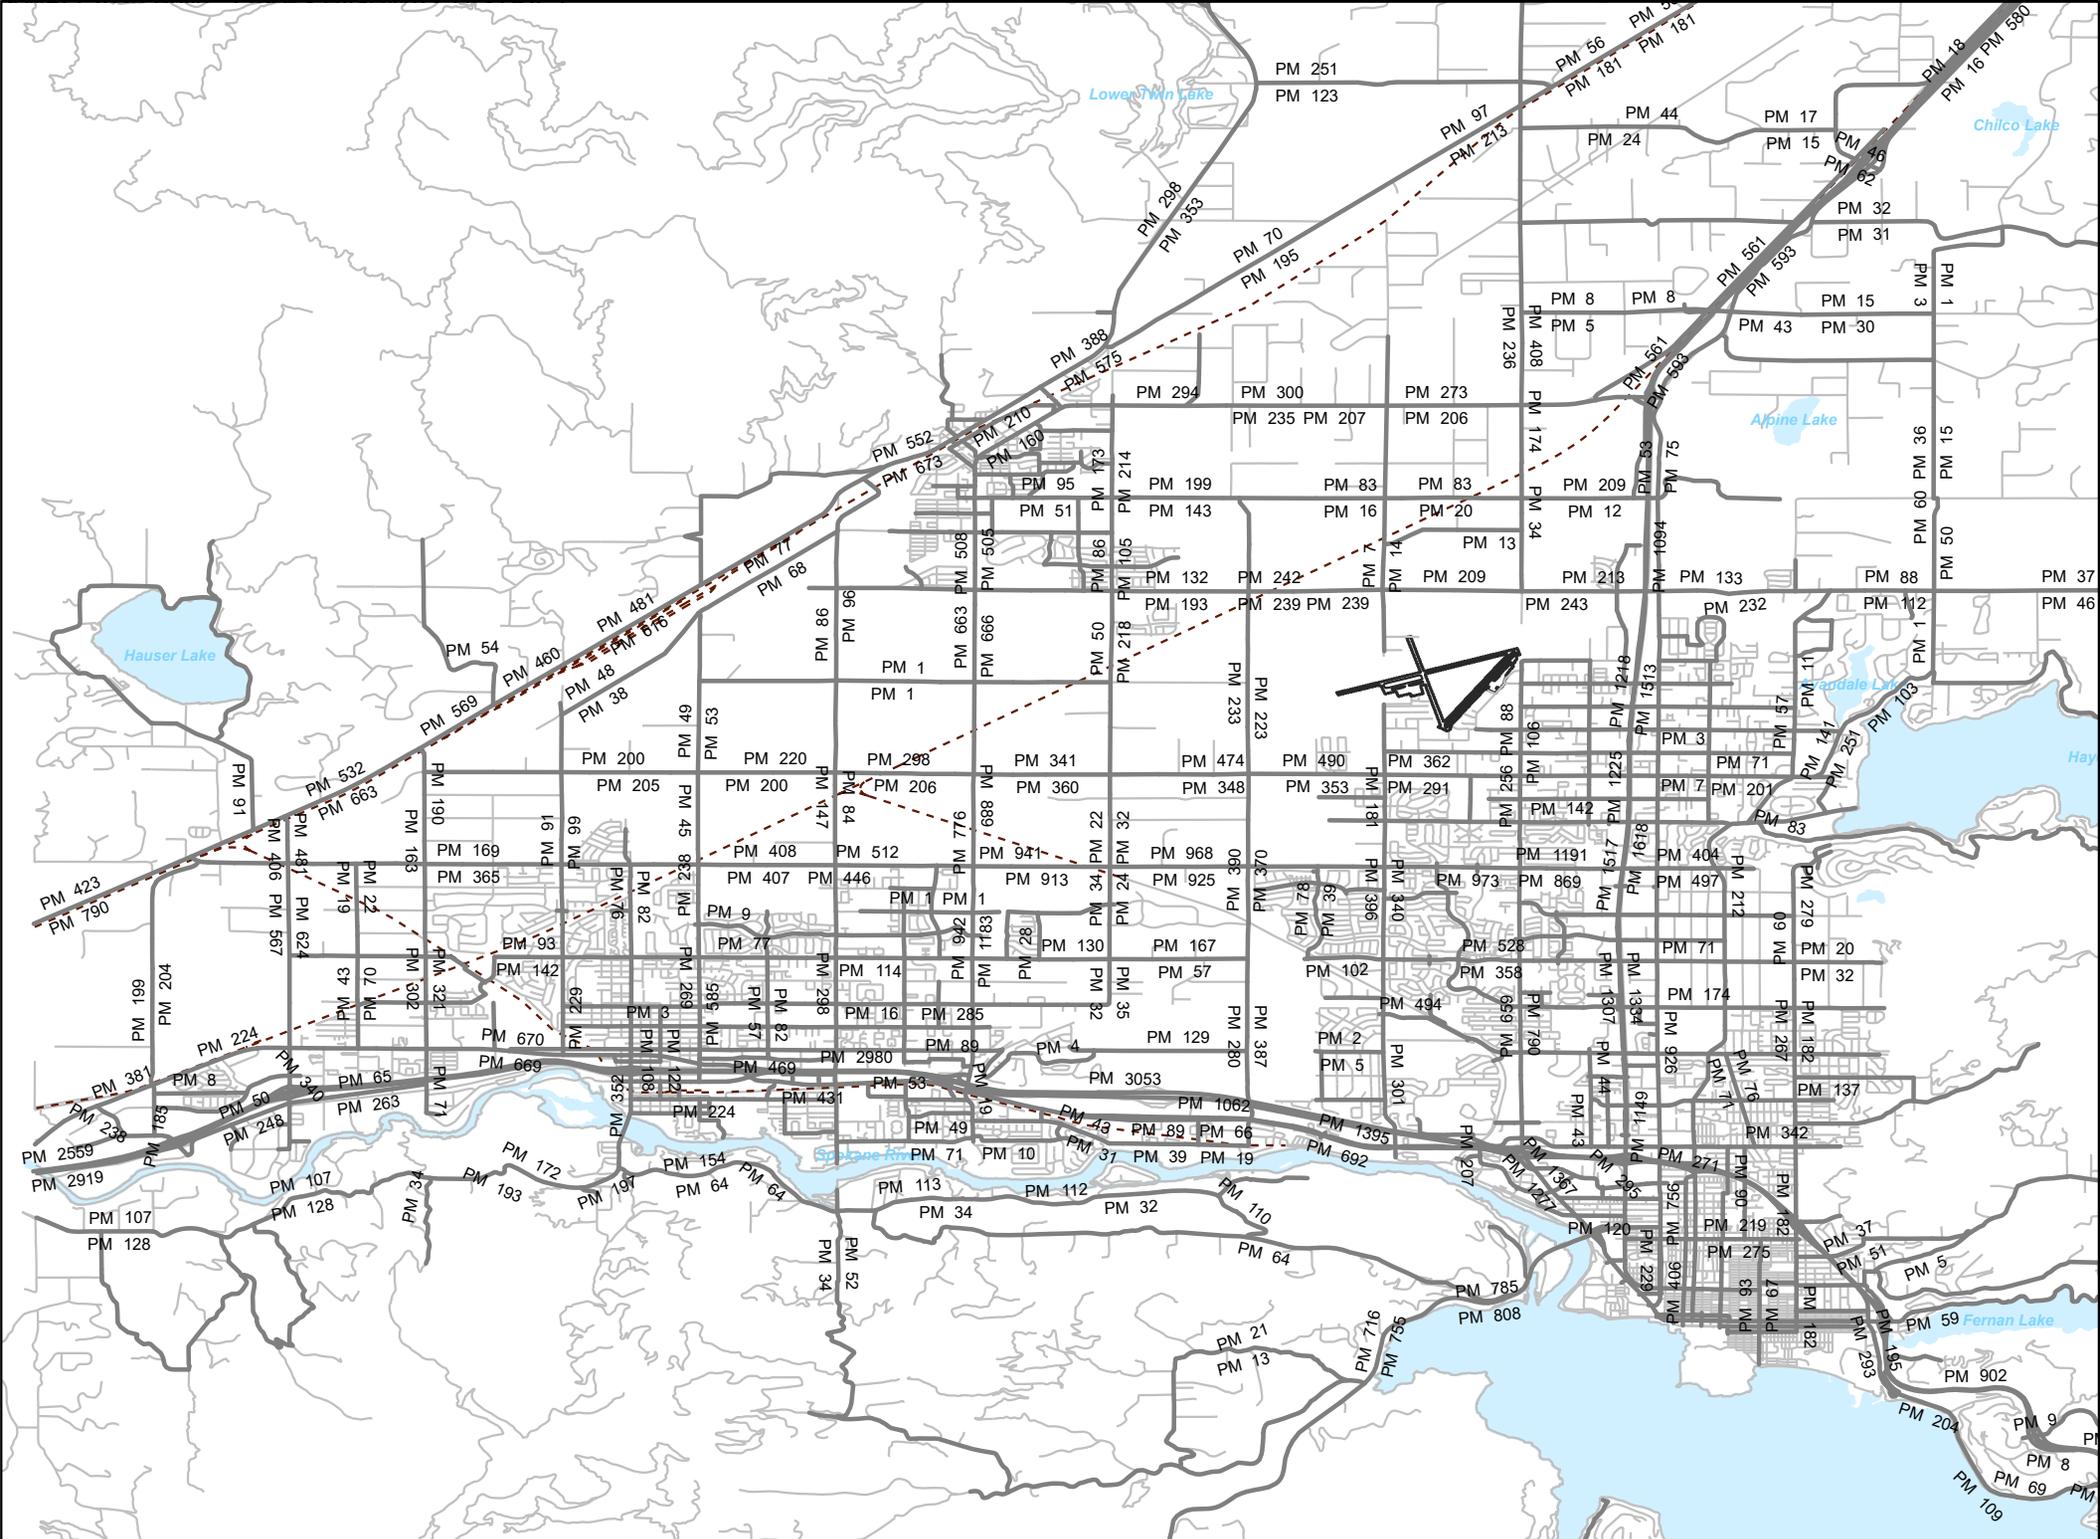

$$Tol (\%) = 1/100 * [(-0.00005*(V)^3 + 0.013*(V)^2 - 1.1822*(V) + 65.465)]$$

*For over 100,000:*

$$Tol (\%) = 2.1783*(V)^{-0.4784}$$

*Where, V is volume in thousands.*

2020 Base Model

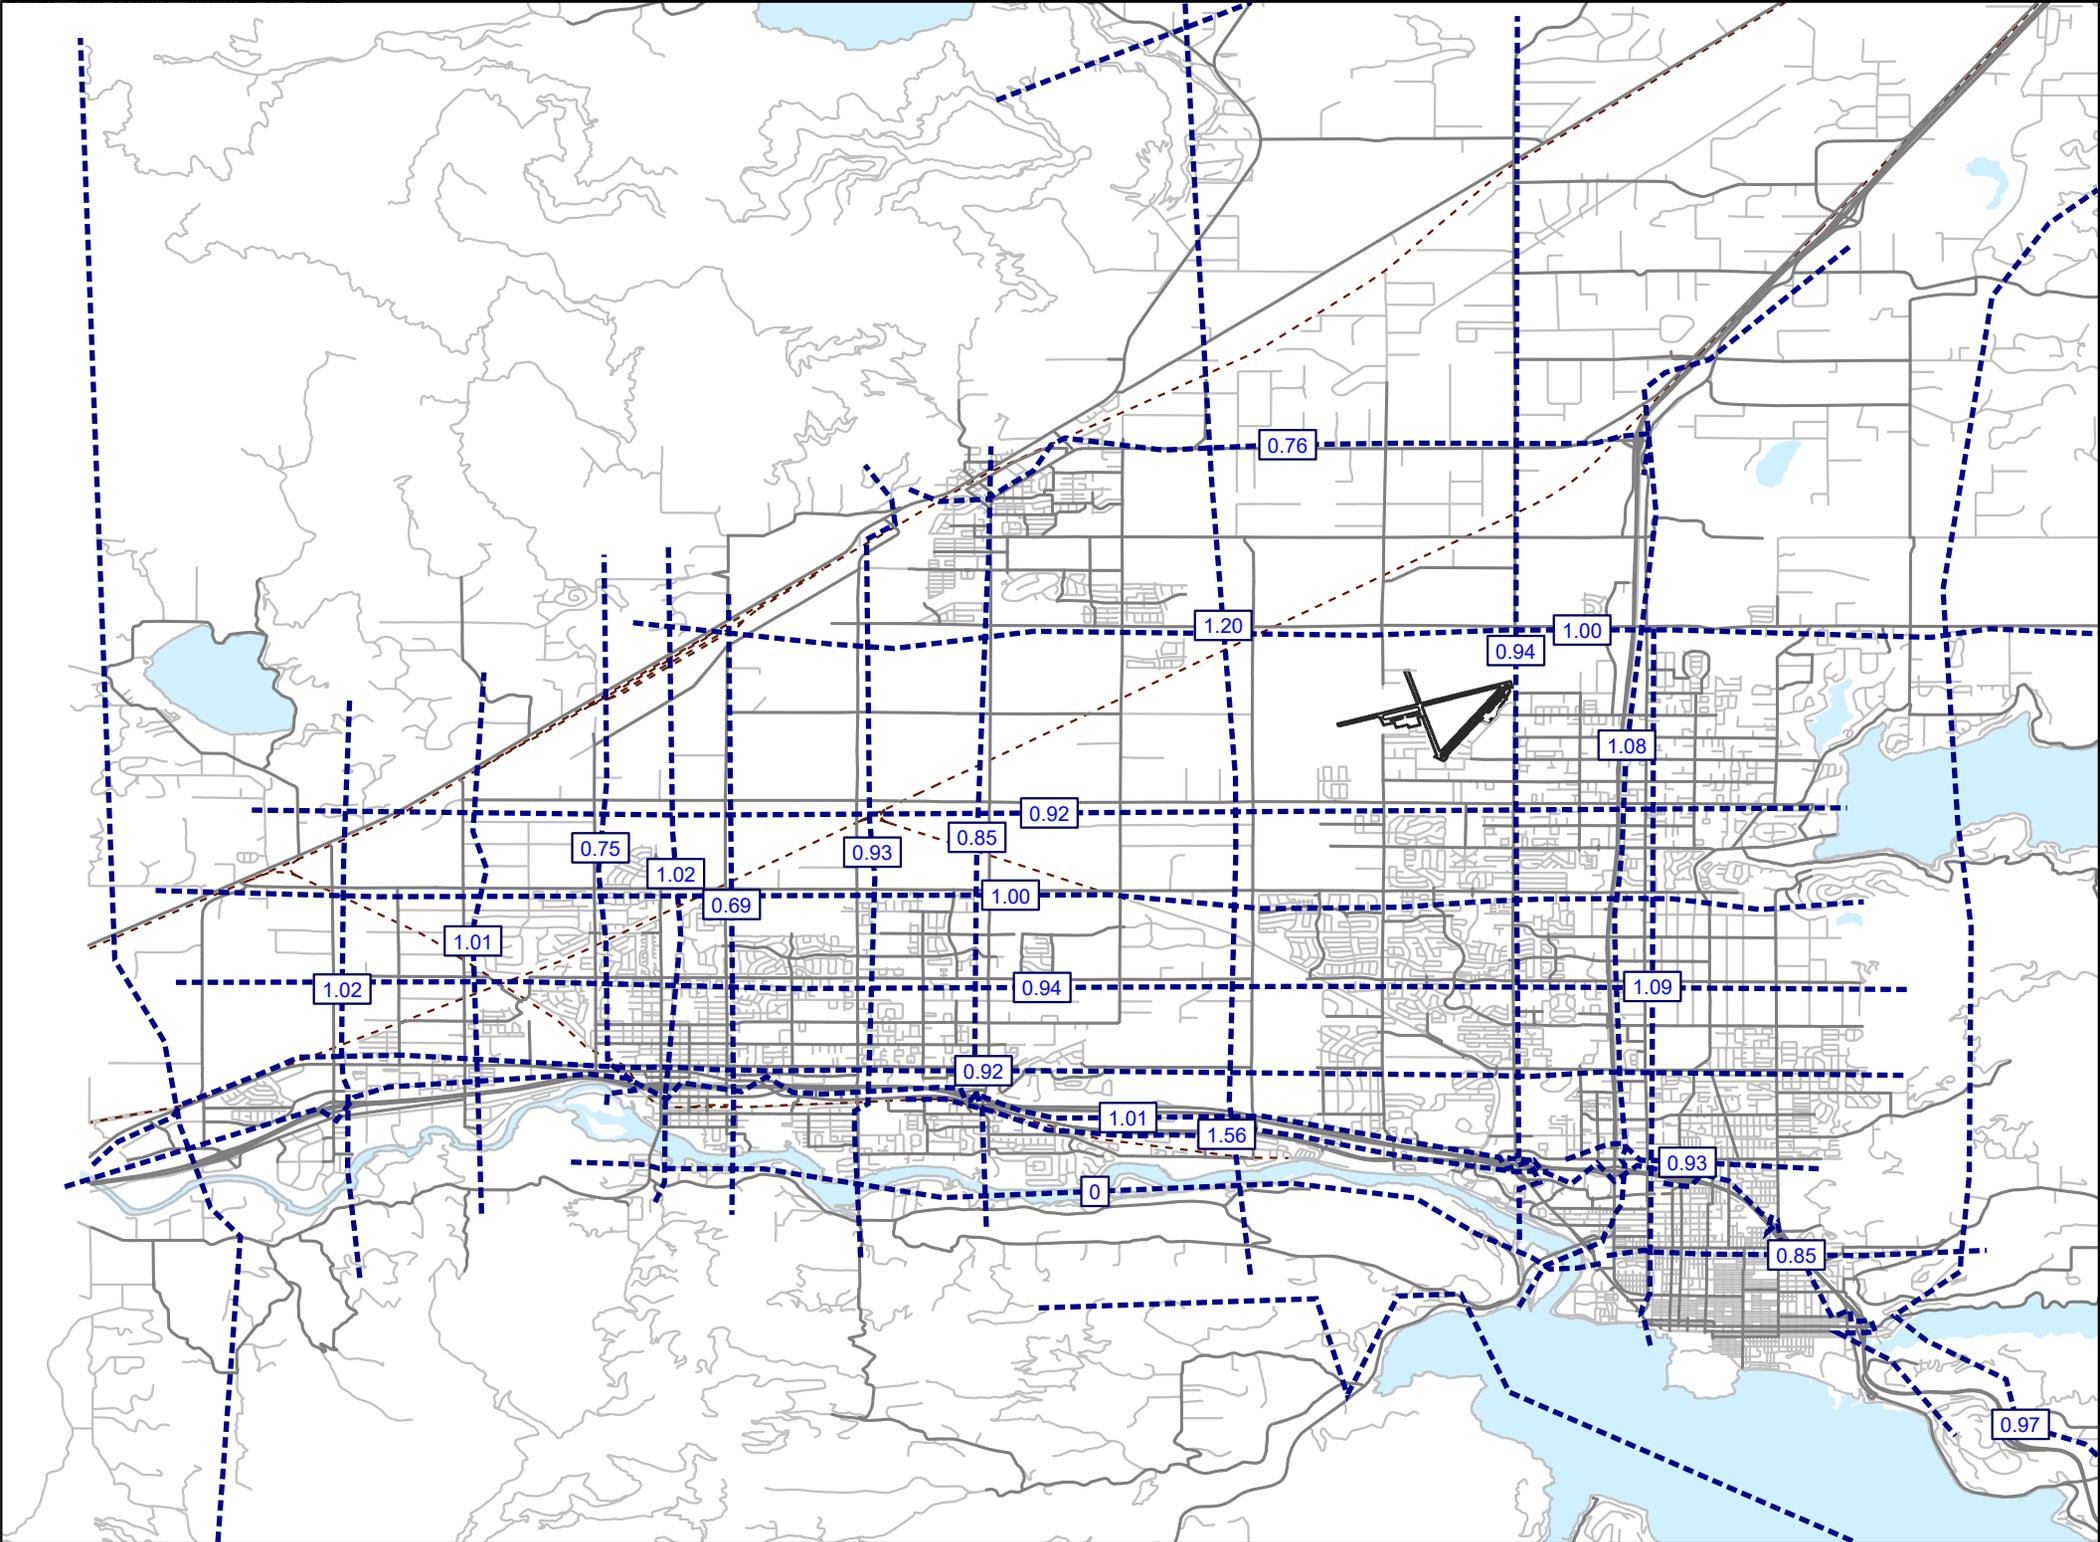

Table 18: AM Screenline Results

By using the formula, the screenlines can be evaluated to see if they meet the percent allowable deviation ranges. By the FHWA standards, the 2020 KMPO Model screenlines are validated for both AM peak hour and PM peak hour. Figures 12 and 13 depict the screenline results for the AM and PM peak hour.

## 6.2.2 Statistical Analysis

The 2020 Base model volumes and 2020 observed traffic counts were compared in VISUM using a scatterplot and several statistical analyses to further validate the trip assignment, which are displayed in Figures 14 and 15. This analysis is incorporated in the Procedure Sequence for both the AM and PM models. This analysis looks at several statistics to evaluate the amount of error in the model and the model's ability to replicate observed conditions. The following statistical analyses are considered:

- %RMSE is a summary statistic representing the average assignment error in percent. This value shows better calibration when it is lower. For the size of the KMPO model area, a %RMSE of 35% or below is recommended. The % RMSE for the 2020 PM run is 34, which falls below the target of 35%. The AM result is 36, which does not meet but is reasonably close to the target.
- $R^2$ , is another statistic used to determine the accuracy of the model results.  $R^2$ , or the “goodness of fit” statistic, shows how the regression line represents the assignment data. A value of 0.88 or higher is very desirable. The  $R^2$  for the 2020 AM and PM runs is 0.85 and 0.86; this is reasonably close to the target, and after discussions with PTV, this is still an acceptable level of validity.
- % In shows the percent of volumes within the recommended allowable error. FHWA recommends that 80% or more of the assigned volumes on roadways classified as principal arterials or higher are within these standards. The 2020 AM run results in 87% of volumes are within the allowable error range. The PM run has 85% within the range. Both runs exceed the standard.
- Slope shows the slope of the regression line. Ideally this line would have a slope of 1.0; there is no standard for this value. The 2020 AM model run has a slope of 0.95, and the PM run results in a slope of 0.96. This represents that the model volumes are slightly lower than current conditions.

After the review of these analyses, it is determined that the 2020 KMPO Model is validated for both AM peak hour and PM peak hour and can be used to model current conditions and build future year travel demand models in the KMPO area.

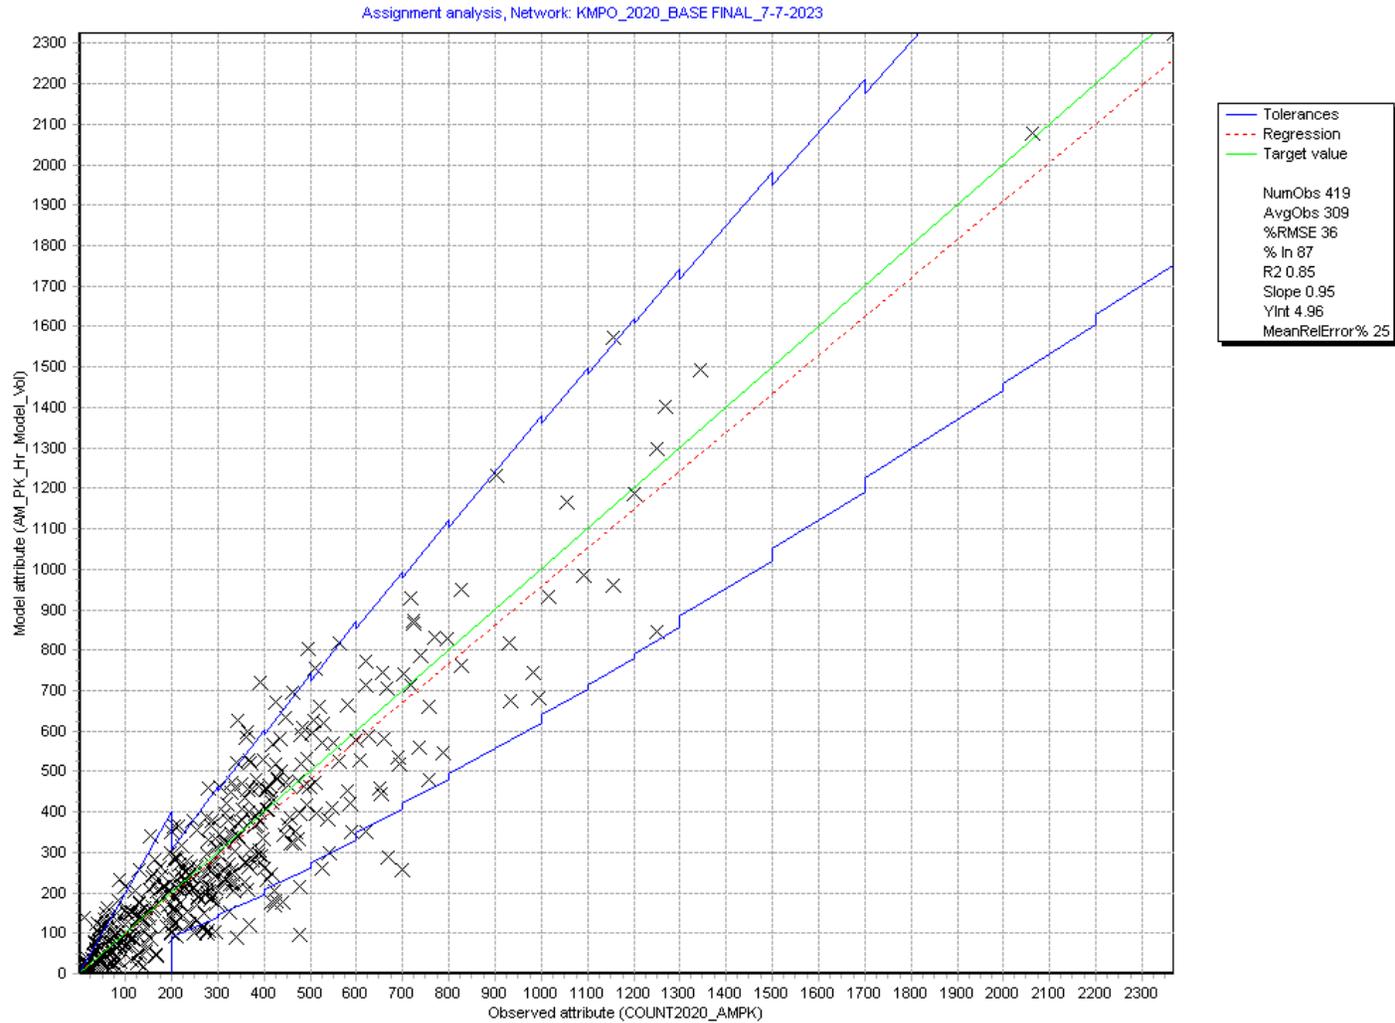

Figure 14: AM Peak Hour Assignment Analysis Results

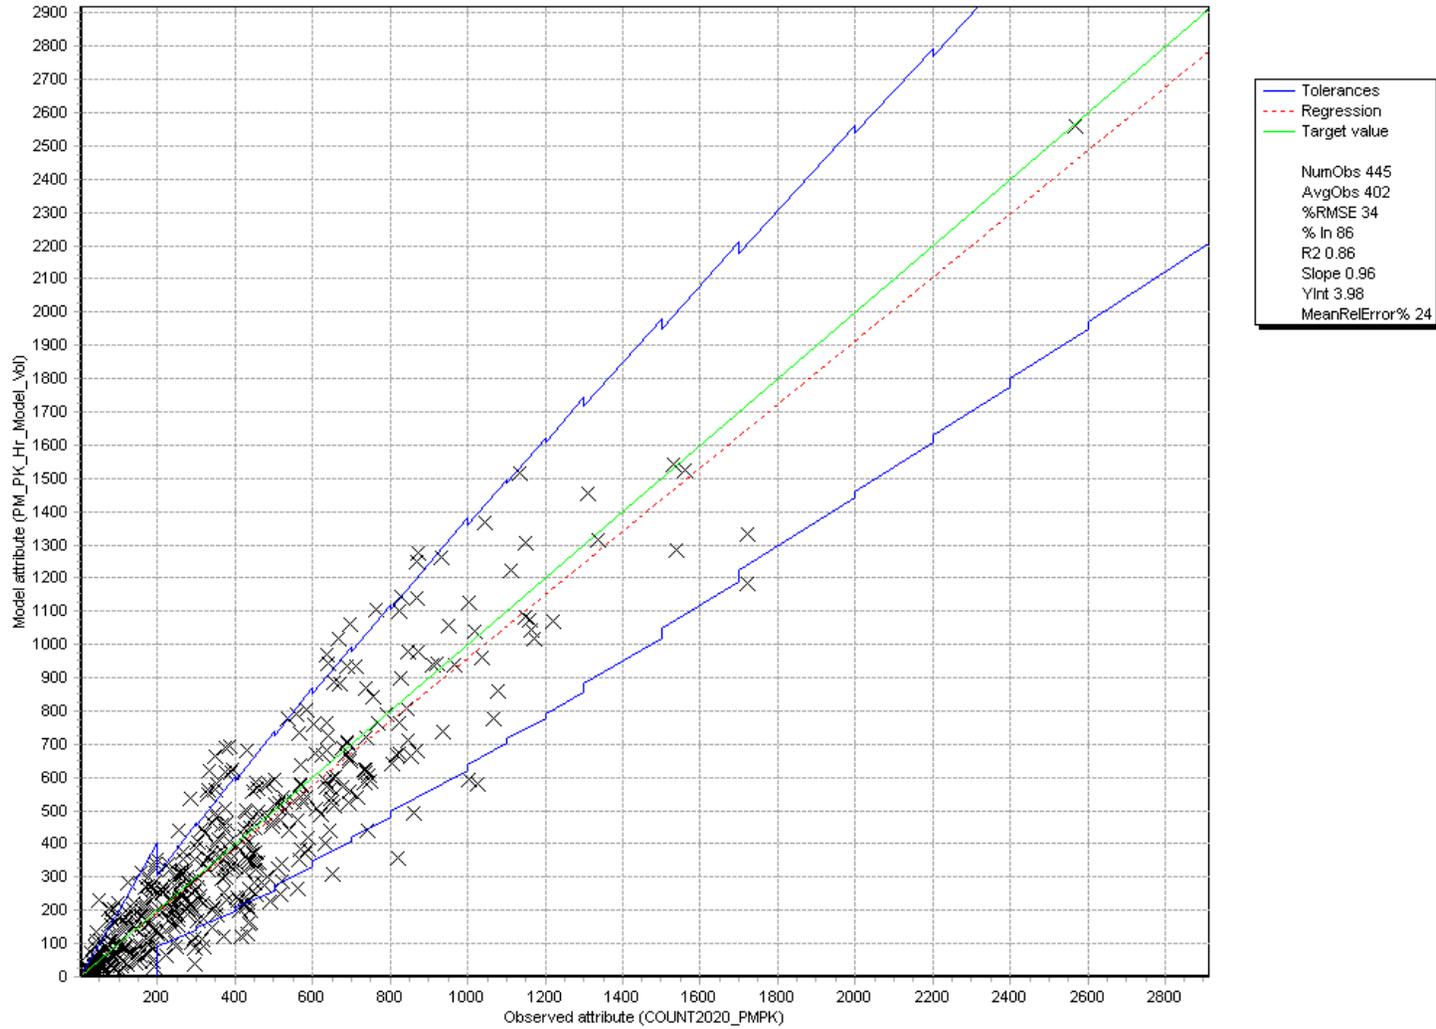

Figure 15: PM Peak Hour Assignment Analysis Results

## 7.0 Model Forecasts

KMPO develops forecast models for the purpose of analyzing anticipated future conditions. Forecast model populations and land use are based off of the population and employment projections adopted by the KMPO Board; the Board adopted the most recent projections, based on the 2020 Census and historical trends, on September 8, 2022.

The No-Build scenario for forecasted models is the base modeling scenario, which includes projected land use growth but only transportation projects that are currently programmed in KMPO’s Transportation Improvement Program (TIP) and development-driven projects that are reasonably expected to be constructed by the forecast year.

### 7.1 Roadway Network

The roadway characteristics assumed for the forecast no-build scenarios are depicted in the figures 16 through 19, including roadway classification, capacity, speed and intersection control.

### 7.2 No-Build Forecast Projects

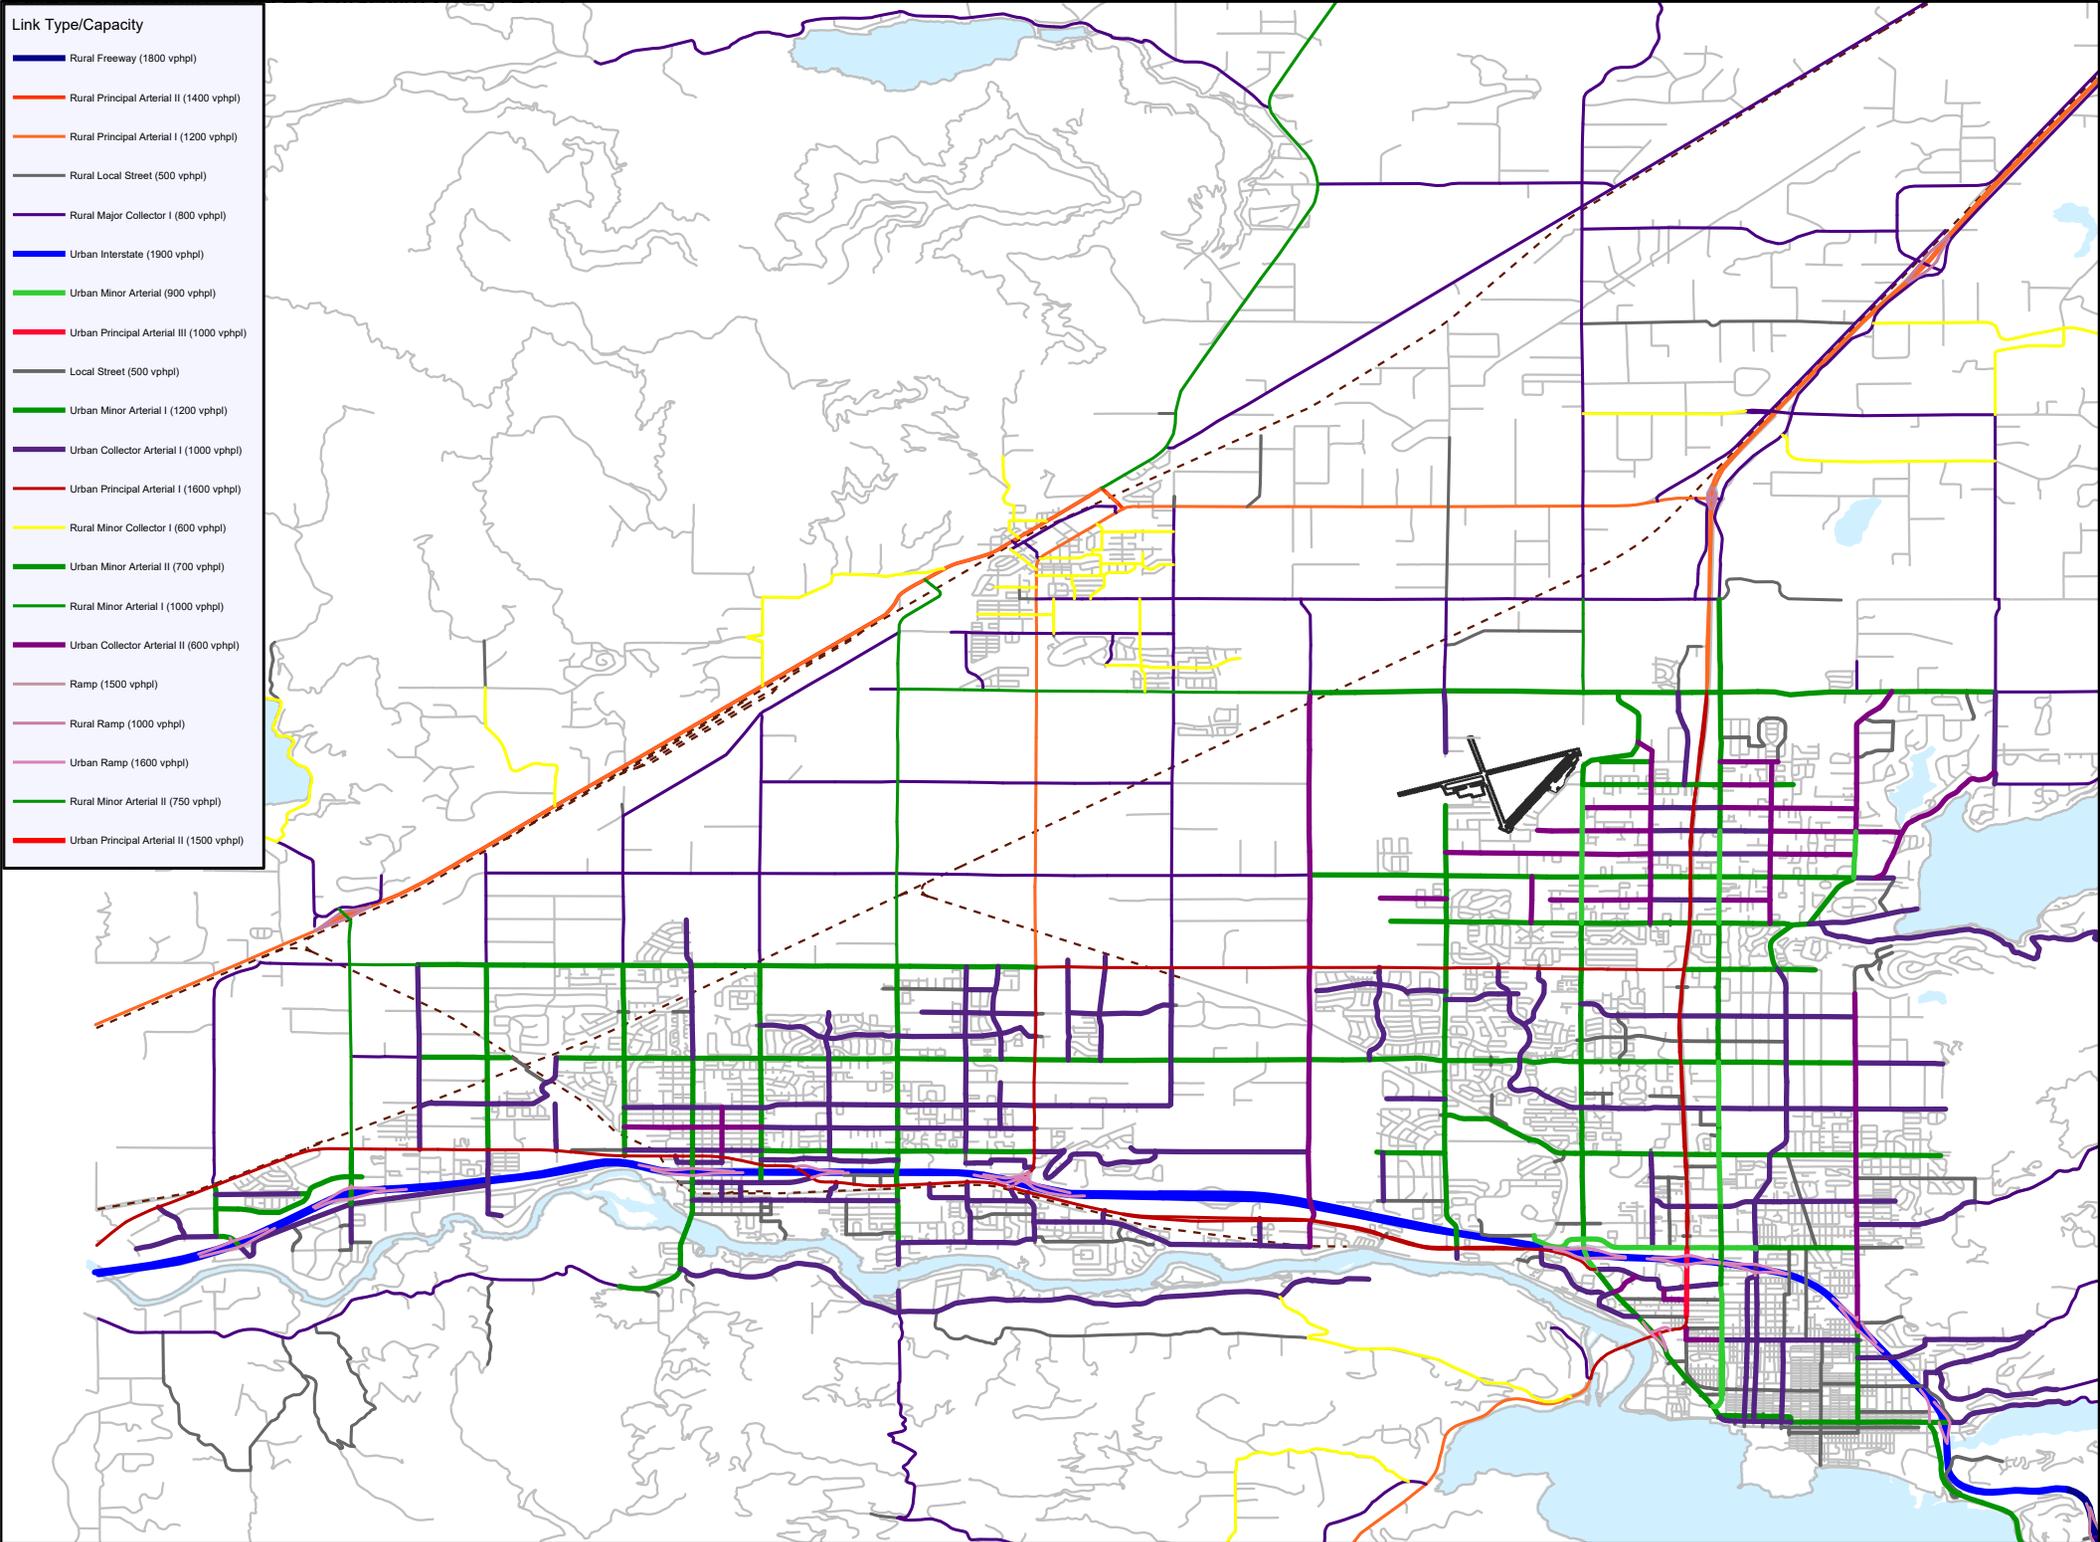

No Build scenario projects consist of major roadway projects included in KMPO’s Transportation Improvement Program (TIP), as well as development-driven projects reasonably anticipated to be constructed by the forecast year. Programmed projects are listed in Table 21, and Table 22 lists the development-driven projects likely to be constructed.

**Table 20: 2023-2029 Transportation Improvement Projects included in 2035 Model**

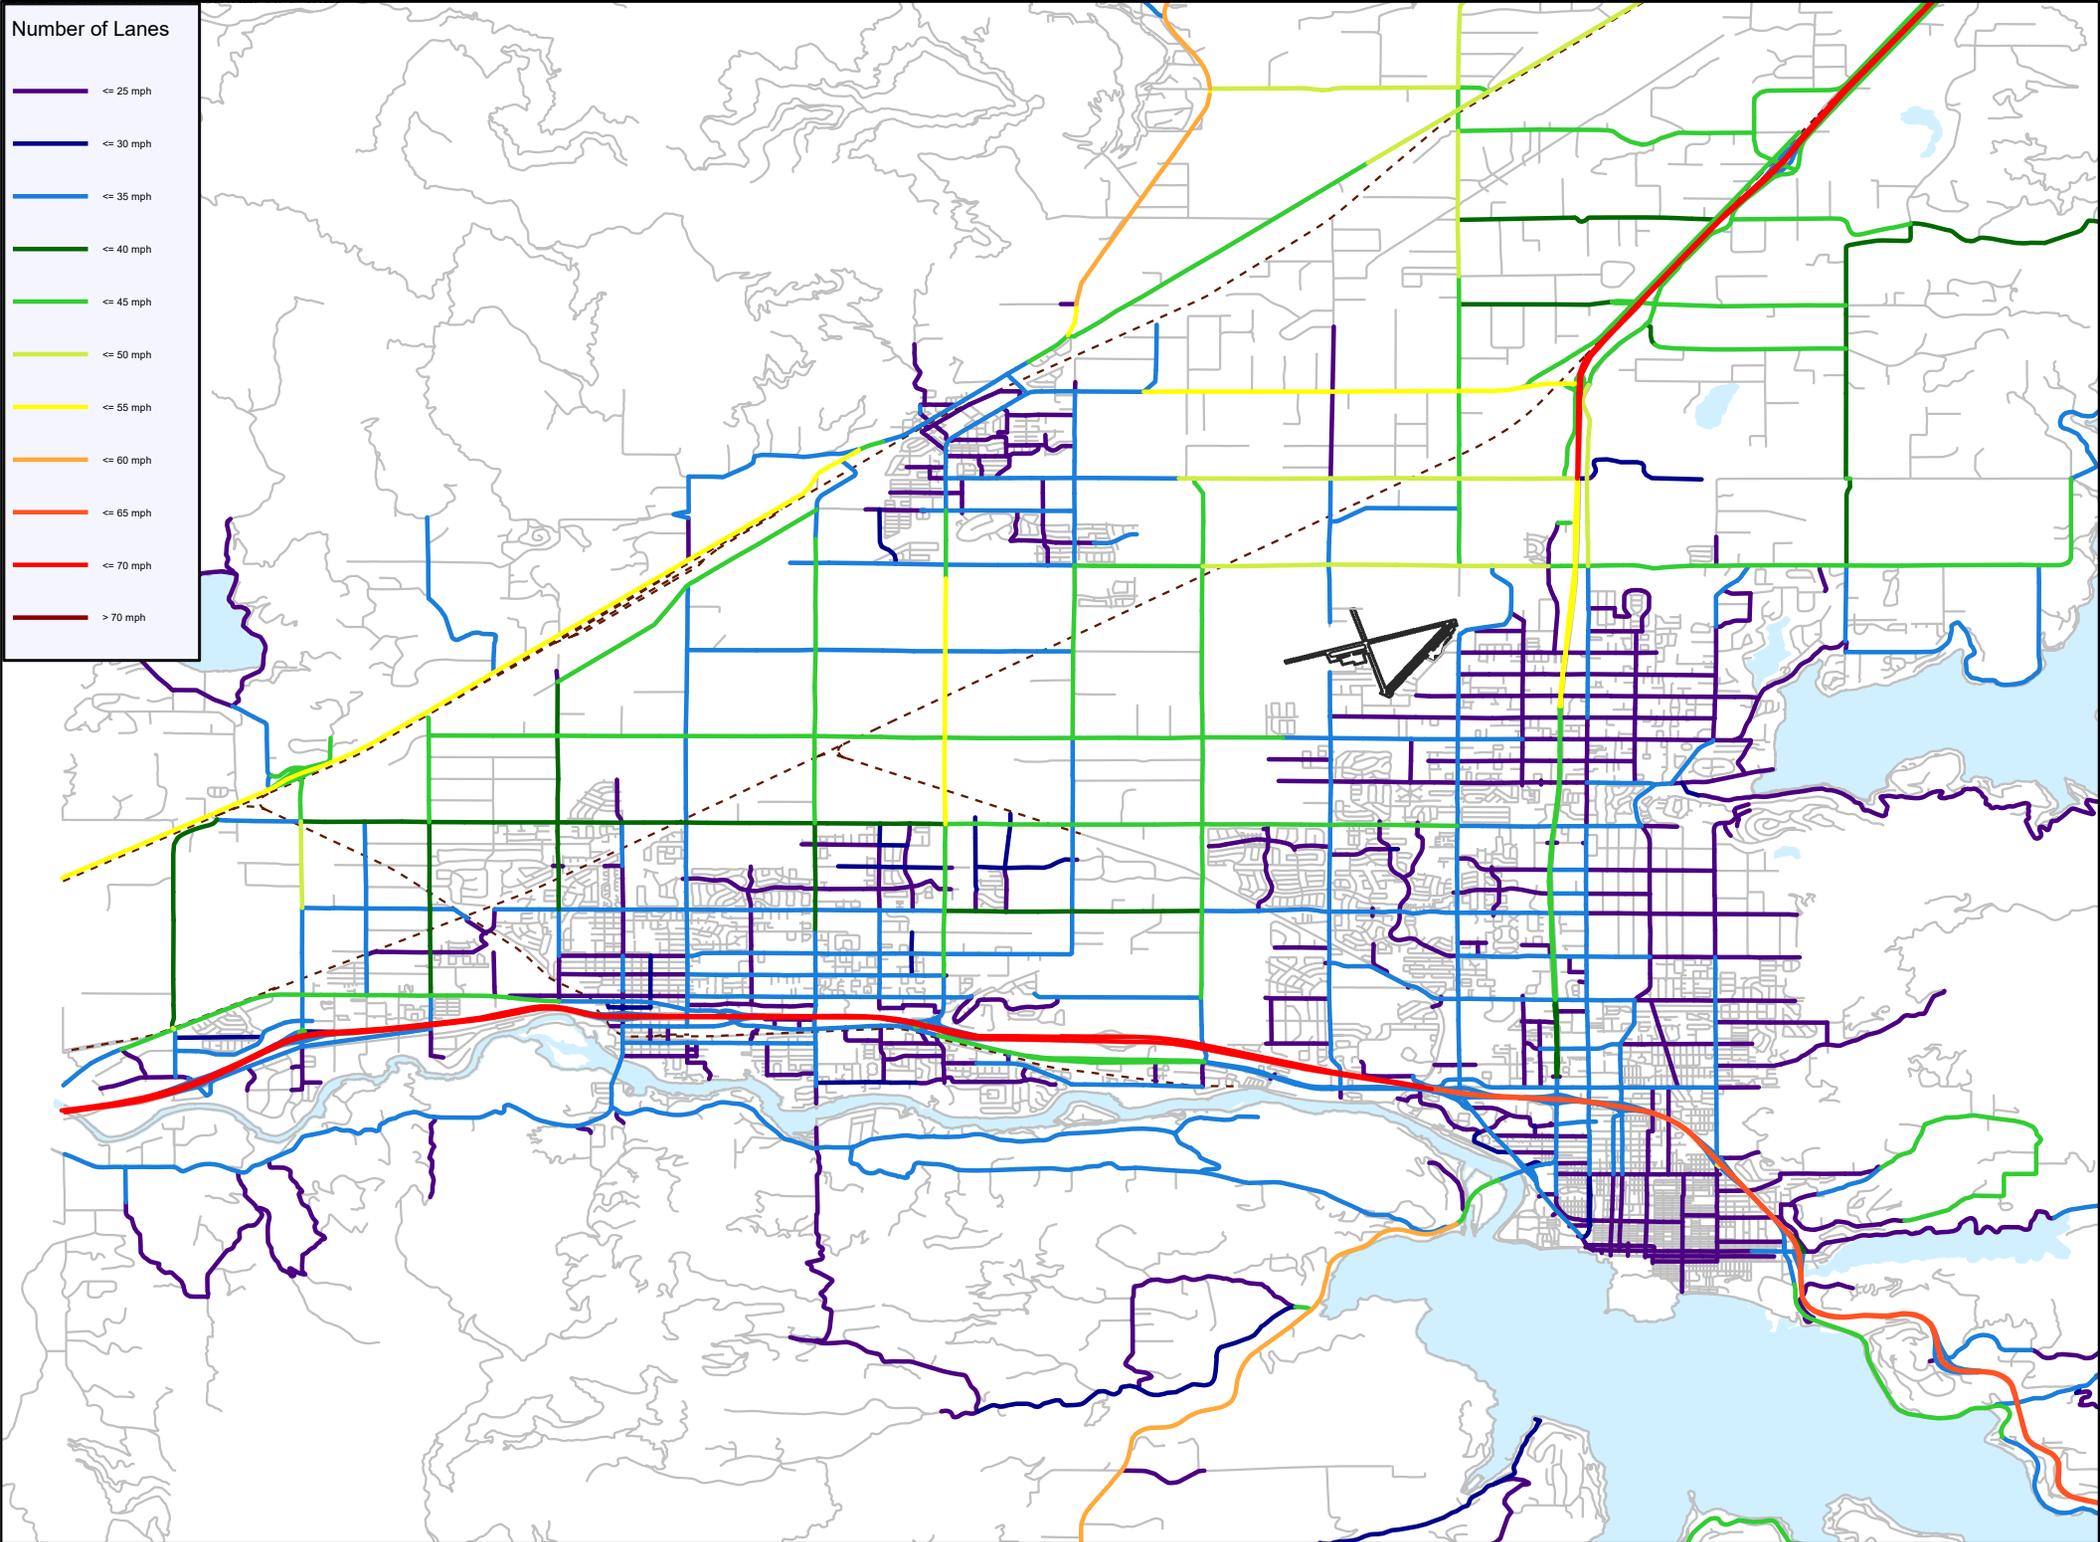

Construction Year	Project	Agency
2029	Pleasant View Rd Interchange; Close SH-53 & Prairie and SH-53 & McGuire Rd.	ITD
2024	Ramsey Road Extension	City of Hayden
2023	Boekel Rd – Meyer Rd Roundabout	City of Rathdrum
2023	US 95, IC #430 to Lacrosse Ave Widening	ITD

### 7.3 Interim Year Model

The interim model year for the KMPO model is 2035. Table 23 illustrates the anticipated land use totals for 2035.

**Table 22: 2035 Projected Housing and Employment Totals**

Occupied Dwelling Units	98,657
Total Employment	44,895

#### 7.3.1 Land Use

Table 24 includes a comparison between 2020 and 2035 land uses. The 2035 land use totals were controlled to the forecasts adopted by the KMPO Board. Detailed land use data can be found in Appendix C.

**Table 23: 2035 Land Use**

Land Use	Unit	2035	2020	Change
LU1: SFDU (Single Family Dwelling Units)	Dwelling Units	64,574	46,591	17,983
LU2: MFDU (Multi-Family Dwelling Units)	Dwelling Units	17,968	10,321	7,647
LU3: Retail	Employees	10,621	8,616	2,005
LU4: Commercial (FIRES)	Employees	3,813	3,095	718

LU 22: Utilities & Construction	Employees	7,030	5,707	1,323
LU 23: Food Services	Employees	7,950	6,445	1,505

#### 7.3.2 External TAZs

External station counts were adjusted for growth based on the 10-year average growth rate of the nearest ATR.

Table 25 shows the adjusted 2035 counts at the external to internal (X-I) and internal and external (I-X) count locations for both the AM peak hour and PM peak time frames.

**Table 24: 2035 AM/PM Peak Hour Counts at External TAZs**

TAZ #	Location	IX-D-AM	IX-D-PM	XI-O-AM	XI-O-PM
900	State Hwy. 41 - N. County Line	198	309	43	121

### 7.3.3 Trip Generation

Trip productions and attractions are balanced in the model to ensure there is an attraction for each production generated by the model. Tables 28 and 29 summarize the AM and PM peak hour vehicle trips by purpose.

**Table 27: 2035 AM Trips**

Trip Purpose	2035 AM Peak Hour Trips	2020 AM Peak Hour trips	Growth in trips
Home Based Work	19,582	14,268	5,314
Home Based Retail	5,047	3,650	1,397
Home Based Other	22,867	16,531	6,336
Non-Home Based	15,479	12,211	3,268
Home Based School	13,481	10,196	3,285
TOTAL	<b>76,456</b>	<b>56,856</b>	<b>19,600</b>

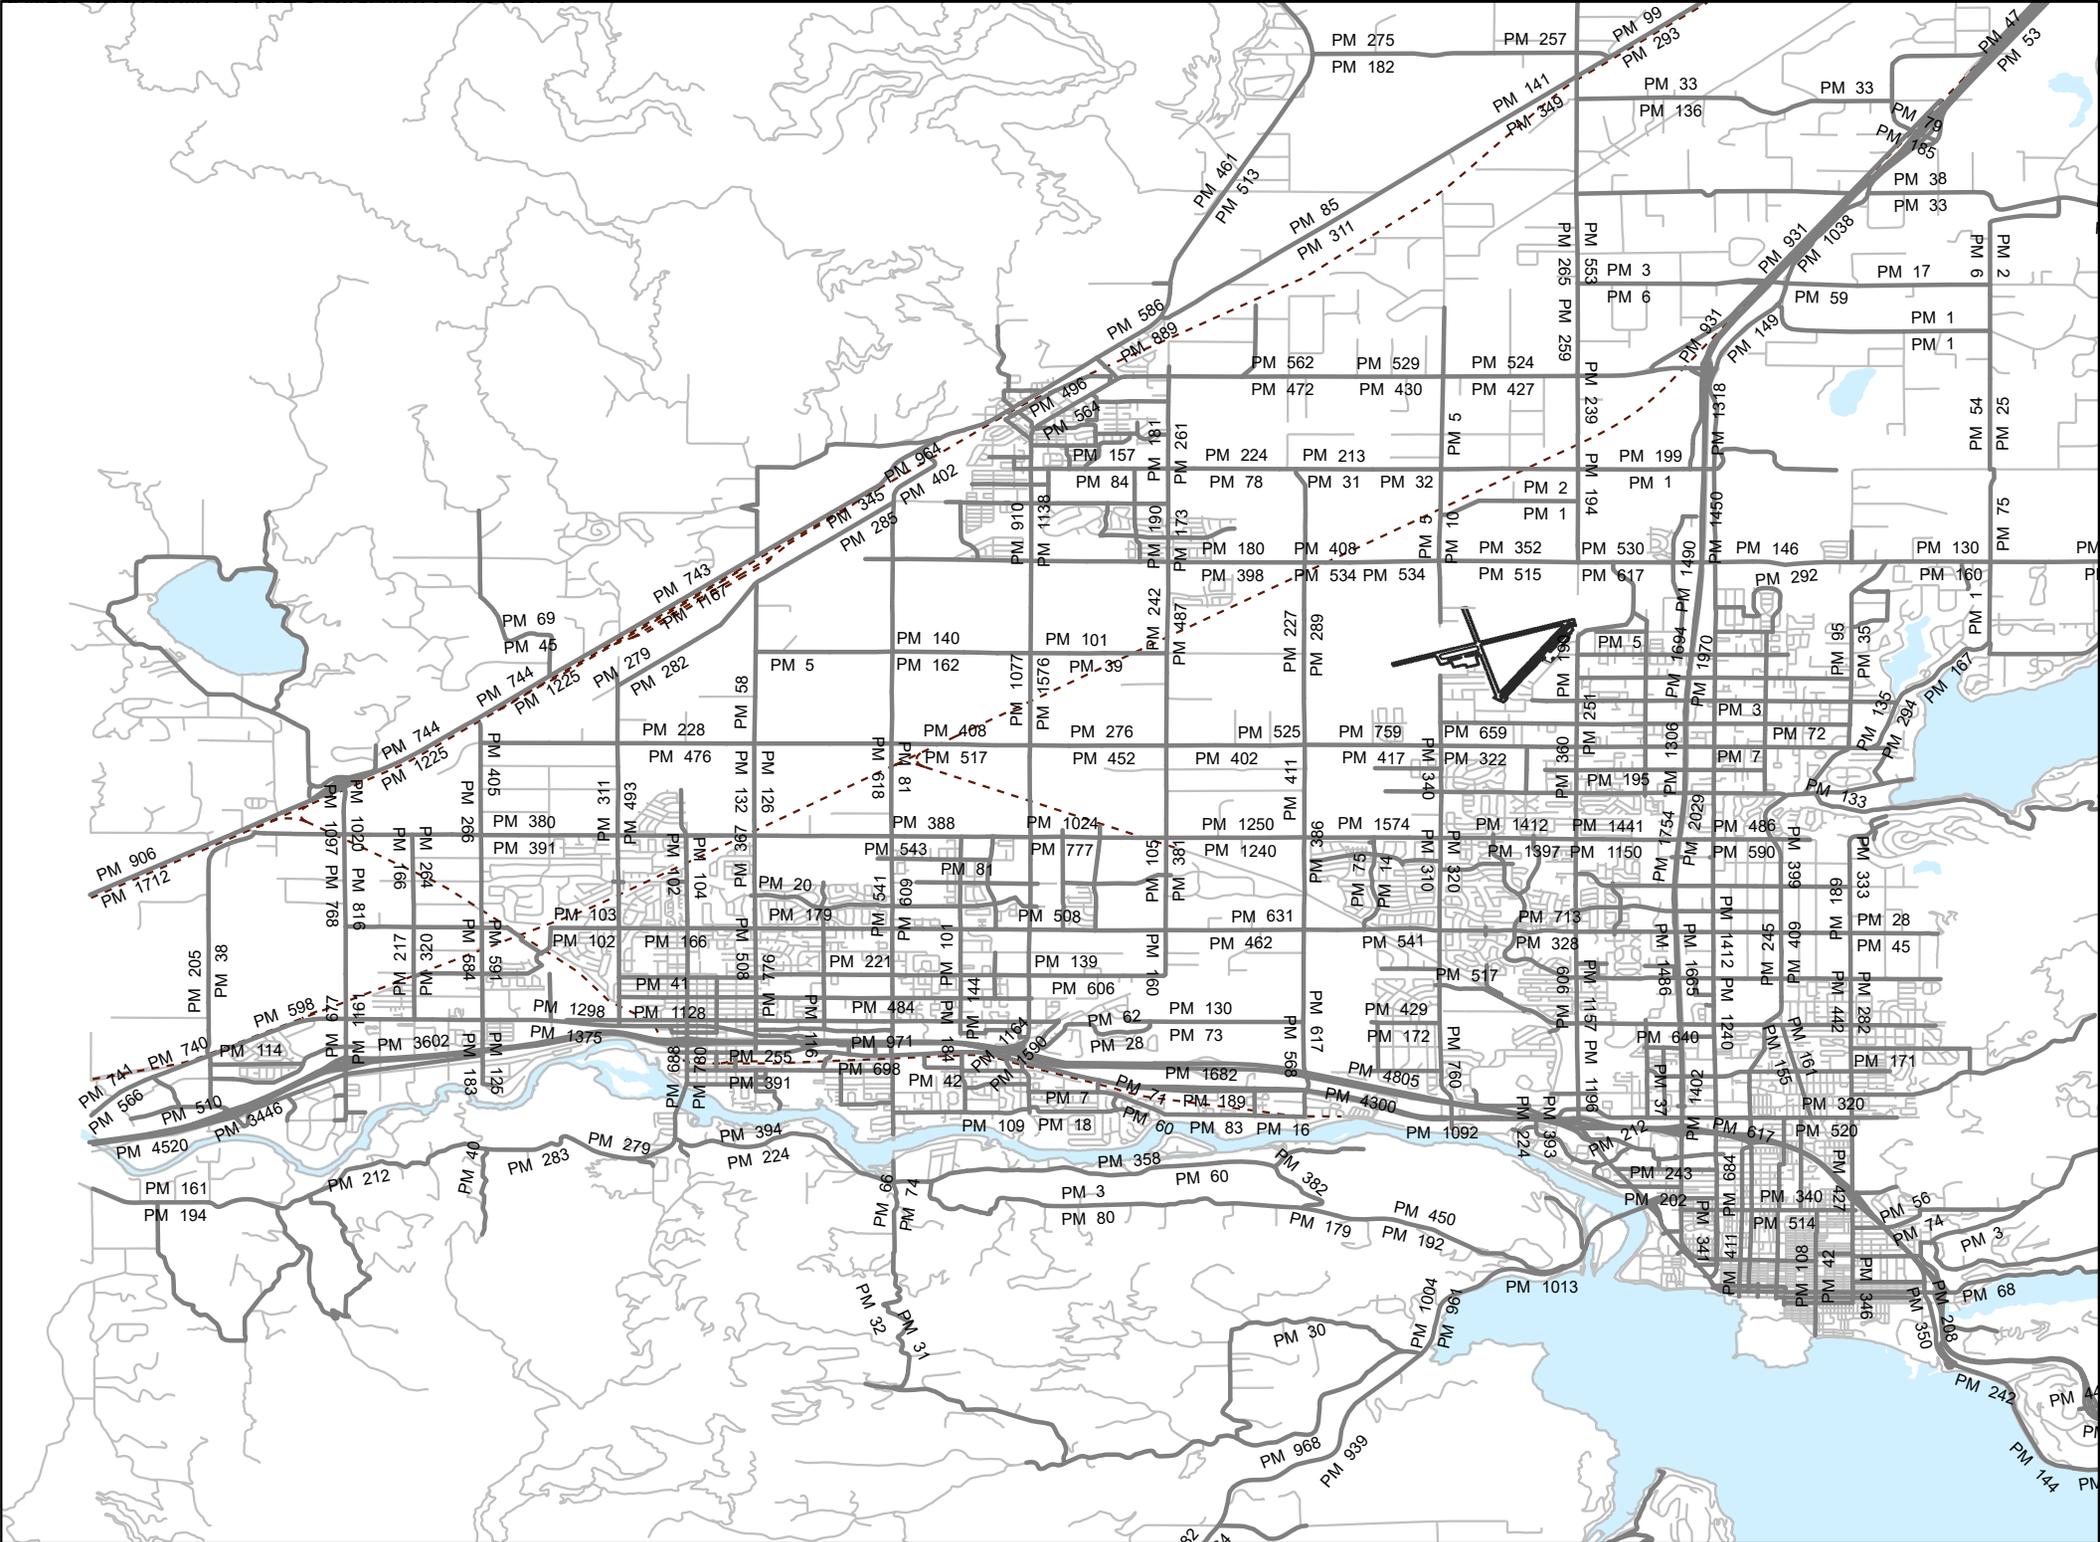

**Table 28: 2035 PM Trips**

Trip Purpose	2035 PM Peak Hour Trips	2020 PM Peak Hour trips	Growth in trips
Home Based Work	13,714	10,025	3,689
Home Based Retail	11,467	8,470	2,997
Home Based Other	49,044	35,610	13,434
Non-Home Based	23,406	18,520	4,886
Home Based School	1,523	1,150	373
TOTAL	<b>99,154</b>	<b>73,775</b>	<b>25,379</b>

### 7.3.4 Trip Assignment

The 2035 assignment results are depicted in Figures 20 and 21 for the AM and PM model runs.

2035 Interim Model

## 7.4 Forecast Year Model

The forecast model year for the KMPO model is 2045. Table 30 illustrates the anticipated land use totals for 2045.

**Table 29: 2045 Projected Housing and Employment Totals**

Occupied Dwelling Units	124,677
Total Employment	71,850

### 7.4.1 Land Use

Table 31 compares land use categories between the 2020, 2035 and 2045 model years. The 2045 land uses were controlled to the forecasts adopted by the KMPO Board. Detailed land use data can be found in Appendix C.

**Table 30: 2045 Land Use**

Land Use Type	Unit	2045	2035	10-year Growth	2020	25-year Growth
LU1: SFDU (Single Family Dwelling Units)	Dwelling Units	76,510	64,574	11,936	46,591	29,919
LU2: MFDU (Multi-Family Dwelling Units)	Dwelling Units	29,233	17,968	11,265	10,321	18,912

### 7.4.2 External TAZs

External station counts were adjusted for growth based on the 10-year average growth rate of the nearest ATR.

Table 32 shows the adjusted 2045 counts at the external to internal (X-I) and internal and external (I-X) count locations for both the AM and PM peak hour frames.

**Table 31: 2045 AM/PM Peak Hour Counts at External TAZs**

### 7.4.3 Trip Generation

Trip productions and attractions are balanced in the model to ensure there is an attraction for each production generated by the model. Tables 34 and 35 summaries the AM and PM peak hour vehicle trips by purpose.

**Table 34: 2045 AM Trips**

Trip Purpose	2045 AM Peak Hour Trips	2035 AM Peak Hour Trips	2020 AM Peak Hour trips	Growth in trips 2035 to 2045	Growth in trips 2020 to 2045
Home Based Work	23,672	19,582	14,268	4,090	9,404
Home Based Retail	6,225	5,047	3,650	1,178	2,575
Home Based Other	27,640	22,867	16,531	4,773	11,109
Non-Home Based	17,873	15,479	12,211	2,394	5,662
Home Based School	16,197	13,481	10,196	2,716	6,001
TOTAL	91,607	76,456	56,856	15,151	34,751

**Table 35: 2045 PM Trips**

Trip Purpose	2045 PM Peak Hour Trips	2035 PM Peak Hour Trips	2020 PM Peak Hour trips	Growth in trips 2035 to 2045	Growth in trips 2020 to 2045
Home Based Work	16,658	13,714	10,025	2,944	6,633
Home Based Retail	14,004	11,467	8,470	2,537	5,534
Home Based Other	59,482	49,044	35,610	10,438	23,872
Non-Home Based	27,205	23,406	18,520	3,799	8,685
Home Based School	1,843	1,523	1,150	320	693
TOTAL	119,192	99,154	73,775	20,038	45,417

### 7.4.4 Trip Assignment

The 2045 assignment results are depicted in Figures 22 and 23 for the AM and PM model runs.

## 8.0 User's Guide

The model was developed using PTV's VISUM software. A basic understanding of VISUM is required to manage and run the model.

All files needed to run the model are zipped into a deliverable package, including model filters, graphic parameters, layouts, and the VISUM version file. The following version files are the final versions represented in this document:

- KMPO\_2020\_BASE\_FINAL\_7-7-2023
- KMPO\_2035\_NoBuild 10-5-2023
- KMPO\_2045\_NoBuild 7-24-2023

These zip files can be made available upon request, at the discretion of KMPO. The newest version should be requested from the KMPO prior to beginning any project.

Figure 24 illustrates the "Procedure Sequence" for running the model.

Figure 24: VISUM Procedure Sequence for KMPO Model

120	Procedure	Reference object(s)	Variant/file	Messages	Comment
1	Group Capacity calculation -	48 / 48		✓	Capacity calculation - Calculate Procedu
2	Reset all filters			✓	
3	Read filter		TSysCar.fil	✓	
4	Edit attribute	Links - CapPrT		✓	Set Link Capacity, Lanes * Cap/Lane
5	Edit attribute	Connectors - T0_TSys(C)		✓	Test to set Connector Time
6	Read filter		TWLTl-3Lane.fil	⚠ 1 warnin	3 Lane Road
7	Edit attribute	Links - CapPrT		✓	Add 300 directional capacity
8	Read filter		TWLTl-5Lane.fil	⚠ 1 warnin	5 Lane Road
9	Edit attribute	Links - CapPrT		✓	Add 150 directional capacity
10	Read filter		Fwy_GT_2_Lanes.fil	✓	3+ Lane Fwy
11	Edit attribute	Links - CapPrT		✓	Add Cap for 3 Lane + Fwy
12	Edit attribute	Nodes - K4		✓	Set All K4 = 1.0
13	Read filter		ActiveLinksNodes.fil	✓	Start Node Computations
14	Edit attribute	Nodes - CapPrT		✓	Add all outbound link capacities
15	Read filter		ActiveLinksNodes-3plusLegs.fil	✓	3 Plus Leg Nodes
16	Edit attribute	Nodes - K4		✓	
17	Read filter		ActiveLinksNodes-2Leg.fil	✓

**Kootenai MPO Planning Model Update**

The KMPO Visum Planning Model was updated to reflect base year 2020 land use conditions under usual traffic patterns in the AM and PM peak hours. This model updated model can now be used to evaluate and compare scenarios. A summary of the task items performed in the update process is provided in this technical memo.

**Network Model Revisions**

A review of the network model was performed in collaboration with KMPO agency staff and intersection turning movement types and geometry (turning lanes) were updated to reflect accurate field conditions. These intersections were primarily located along US 95 and Ramsey corridors.

**Figure 1: Illustration of Detailed Intersection View - US 95 @ W Wyoming Ave**

The KMPO model can use connector weights to load the traffic from model traffic analysis zones (TAZs). These weights can be used for more fine-tuned loading of traffic from the TAZ to the expected loading points in the network. The model does not use connector weights by default. Connector weights in the model are only applied as an option in case of some special short term traffic studies. As a result, the connector weights are not used in long term forecasts. Regardless, the connector weight in the existing model examined and then updated based on count data and aerial imagery to better reflect actual traffic loading points in case these need to be used for some special studies.

**Figure 2: Connector Weights for Traffic Loading****Model Parameter Updates**

The agency provided a model with updated land use data for the year 2020. The model was initially run and tested with existing parameters and updated land use data. Based on observing the results from the model, the following parameters were then adjusted to improve model performance and results.

1. Production and attraction trip rates for model demand strata (trip types) were adjusted to yield balanced production and attraction totals. The adjusted trip rates were set to remain within the ITE trip generation rate ranges.
2. The trip distribution dispersion parameters controlling average trip length were adjusted for each demand strata to yield overall balance between model traffic and count data.
3. The intrazonal skim time was adjusted to have a value equal to one half of the average of the three nearest zones.

A summary of the model parameters is presented in the tables below.

The trip distribution in the model is implemented as a doubly constrained gravity model and uses the TModel functional form for friction factors.

**Figure 3: TModel Functional Form**

The screenshot shows the configuration interface for the TModel functional form. It is divided into several sections:

- Options:** Includes a tab for "Function graph".
- Function type:** A list of radio buttons with corresponding mathematical formulas:
  - Logit:  $f(U) = e^{(c U)}$
  - Kirchhoff:  $f(U) = U^c$
  - BoxCox:  $f(U) = e^{[c (U^b - 1) / b]}$
  - Combined:  $f(U) = U^b e^{(c U)}$
  - TModel:**  $f(U) = 1 / (U^b + c U^a)$  (This option is selected)
- Parameters:** Three input fields for parameters:
  - a: 0
  - b: 2.4
  - c: 0
- Direction of the distribution:** Two radio buttons:
  - Constrained production** (Selected)
  - Constrained attraction
- Doubly-constrained: Balancing by Multi procedure:** A checked checkbox. Below it, a section for "Matrix balancing according to ..." with five radio buttons:
  - Production total
  - Attraction total
  - Mean of both totals** (Selected)
  - Minimum of both totals
  - Maximum of both totals
- Multi parameters:** Two input fields:
  - Maximum number of iterations: 50
  - Quality factor: 3

The parameters specific to each trip type and time of day are shown in the table below.

**Table 3: AM Trip Distribution Model Parameters**

Trip Type	a	b	c
AM_H-O	0	2.4	0
AM_H-R	0	2.4	0
AM_H-S	0	2.6	0
AM_H-W	-0.1	1.7	5
AM_NHB	0	3.1	0
AM_O-H	0	2.4	0
AM_R-H	0	2.4	0
AM_S-H	0	2.6	0
AM_W-H	-0.1	1.7	5

**Table 4: PM Trip Distribution Model Parameters**

Trip Type	a	b	c
PM_H-O	0	1.7	0
PM_H-R	0	1.8	0
PM_H-S	0	2.1	0
PM_H-W	-0.1	1.4	5
PM_NHB	0	2.1	0
PM_O-H	0	1.7	0
PM_R-H	0	1.8	0
PM_S-H	0	2.1	0
PM_W-H	-0.1	1.4	5

**External Travel Update**

External travel in the KMPO model reflects travel between external stations in the model perimeter and between internal traffic analysis zones and external stations. The external-to-external flows are modeled as fixed trip tables for the AM and PM peak hour. The external to internal and internal to external travel is modeled as part of various trip types with rates used to apportion a control total based on station counts. The apportioned trip rates and control totals were analyzed and updated to reflect traffic conditions in 2020. The external counts were used as the primary control totals. The updated control totals and apportioned trip rates related to external travel are presented in the table below.

**Table 5: Updated External-Internal Station Control Totals**

External Station TAZ	XI-O-PM	IX-D-PM	XI-O-AM	IX-D-AM
900	90	195	30	85
901	0	7	159	71
902	0	0	0	0
903	375	410	335	225
904	0	0	0	0

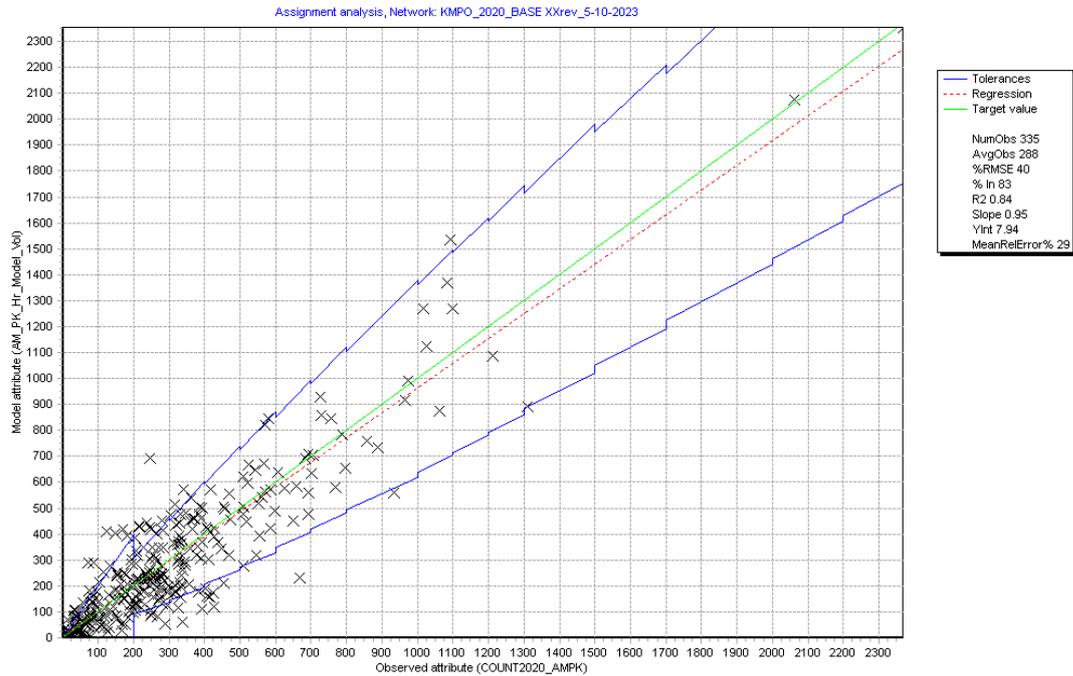

External Station TAZ	XI-O-PM	IX-D-PM	XI-O-AM	IX-D-AM
905	14	14	4	7
906	6	9	16	8
907	277	334	424	370
908	0	0	0	0
909	73	44	7	45
910	3	4	8	3
911	139	96	56	118
912	1	2	2	5
913	32	53	13	22
914	48	40	30	10
915	135	123	63	108
916	2769	2421	1879	2202
917	285	219	110	171
918	840	234	230	647

**Model Validation**

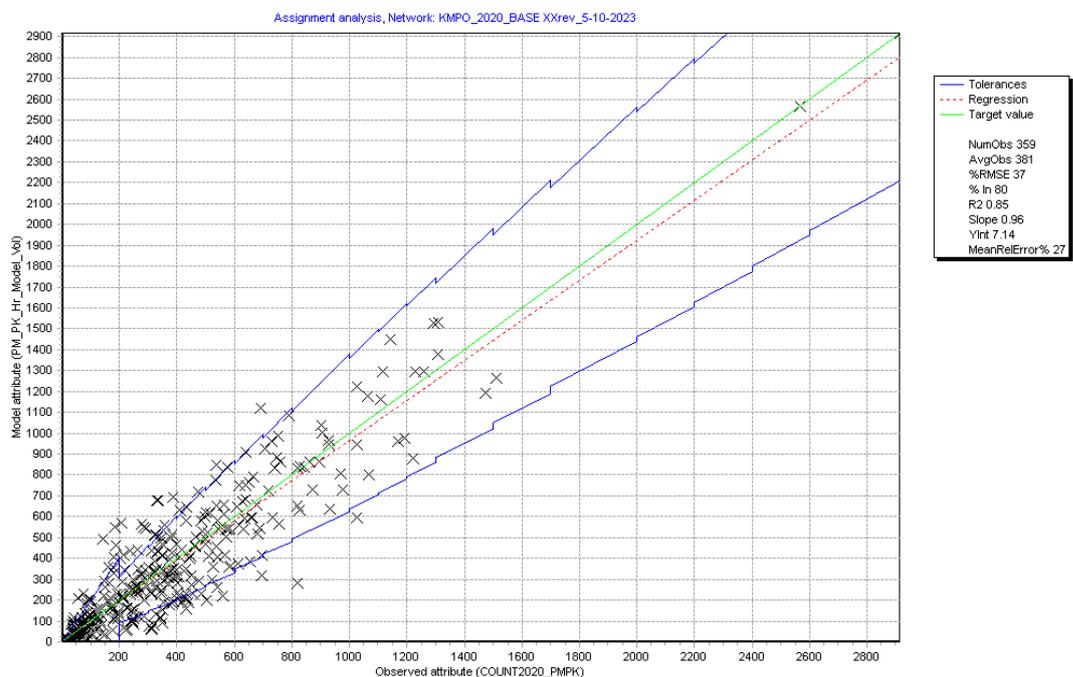

The updated base model was validated against count data at the link level. The count data was assembled using counts from the years 2019 and 2020. Since the traffic patterns in the past three years have been influenced by COVID-19 and some of the counts used in the validation were outdated, the model was not overfit to the observed counts. It is anticipated that more recent count data will be more accurate and will reflect a more normal travel pattern will become available in the coming months. Validation against this new data will allow further refinement of the model in the future if needed.

Both the AM and PM peak hours have RMSE values of 40% and slope 0.95 with 80% or greater within the NCHRP tolerance guidelines. The scatter plots below show model performance against link counts.

**Figure 4: AM Model Validation**

**Figure 5: PM Model Validation**

**INRIX Data Import**

Trip analytics data from INRIX was provided in a csv file with sample trip origin and destination location coordinates. The zones referenced in the INRIX trip list did not correspond to the Visum model TAZ numbers. As a result, a Python script was developed to assign Visum model TAZ numbers to the trips origin and destination locations. The script uses a point-in-polygon method to identify internal zones used in the trip. Trip origins or destinations not found to be within an internal zone polygon were given a value of -1 to TAZ number. This allows identification of trips as either internal, internal to external, external to internal and external to external. The processing script also reads in the INRIX trip list and aggregates it into a trip matrix. Two additional matrices were created in the model to store AM and PM INRIX trip tables.

**Remarks**

The KMPO model was updated to reflect the 2020 base year. This updated model can be used for comparison of development and network scenarios. As stated earlier, the model parameters were not overfit to the counts since some count data may be outdated or inaccurate. Keeping in mind that more updated count data will become available downstream and will likely reflect more current traffic patterns. This data will likely be a more reliable measure of model validation.

**From:** Chetan JOSHI (PTV Group) <chetan.joshi@ptvgroup.com>

**To:** amarienau@kmpo.net  
**Subject:** RE: Additional calibration for the KMPO model

Hi Ali,

A recap of our final model calibration:

1. Updated the XX matrices for AM/PM
2. Updated XI, IX for AM/PM
3. Intrazonal calculation was updated to bring the intrazonal trip distribution between 5-10% of total trips.
4. The model in general seems to overpredict link flows in the N-S corridor/s and underpredict some E-W movements. Changing this might need use of significant K factors, which is not as desirable. A simpler solution would be to use ODME as needed for specific projects and apply NCHRP 765 based adjustments to the forecast model trip tables to obtain corrected link flow trend.
5. Trips on US95 along Chilco are underpredicted against counts. However, the downstream trip pattern seems reasonable. It is not clear where the potential 300 trips exit US95 southbound. Perhaps some more detailed information from other sources like INRIX might help clarify the trip pattern here.

The updated model version is at the link below (version name: KMPO\_2020\_BASE FINAL\_7-5-2023.ver)
